# Dominance frontier (elementary algorithm)

Dominance can be computed by fixed-point iteration:

$$D(r) = \{r\} \text{ and } D(n) = \{n\} \cup \left( \bigcap_{p \in \text{pred}[n]} D[p] \right)$$

Many other more efficient algorithms are possible. Then:

**procedure** computeDF( $n$ )

$S := \{\}$

**for** each node  $y$  in  $\text{succ}[n]$  **do**

**if** ( $\text{idom}(y) \neq n$ ) **then**  $S := S \cup \{y\}$  /\* successor of  $n$  not strictly dominated by  $n$  \*/

**endfor**

**for** each child  $c$  of  $n$  in the dominator tree **do**

    computeDF( $c$ )

**for** each element  $w$  of  $DF[c]$  **do**

**if** ( $n$  does not dominate  $w$ ) **then**  $S := S \cup \{w\}$

**endfor**

**endfor**

$DF[n] := S$

# Example

What is the dominance frontier of node 5?

# Example

First we must find all nodes that node 5 strictly dominates.

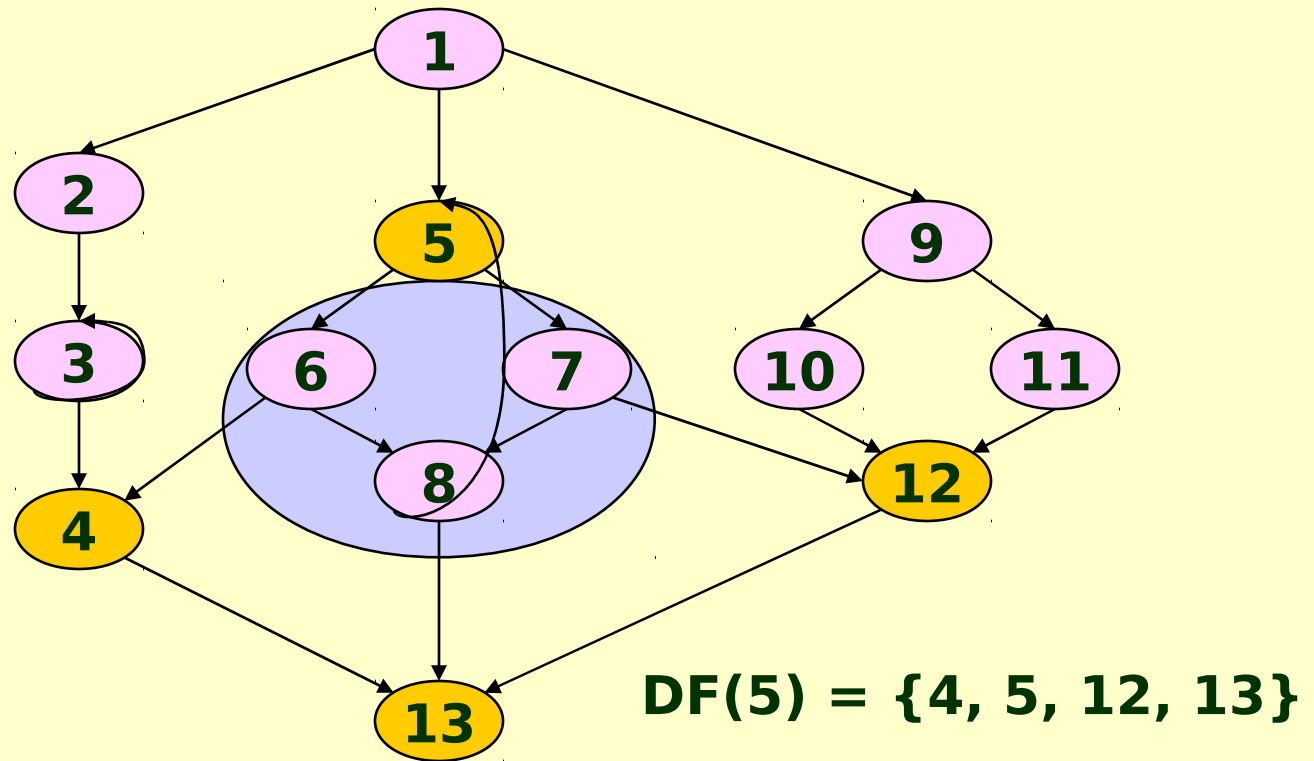

# Example

A node **w** is in the dominance frontier of node 5 if 5 **dominates** a predecessor of **w**, but 5 does not **strictly dominates w** itself. What is the dominance frontier of 5? nization

# Example

A node **w** is in the dominance frontier of node 5 if 5 **dominates** a predecessor of **w**, but 5 does not **strictly dominates** **w** itself. What is the dominance frontier of 5? nization

# Placement of $\phi$ -functions

```
procedure Place- $\phi$ -functions( $G, DF, \mathcal{D}$ ) /*  $\mathcal{D}[n]$  is the set of variables defined in  $n$  */
  for each node  $n$  in  $G$  do
    for each variable  $a$  in  $\mathcal{D}[n]$  do
       $defsites[a] := defsites[a] \cup \{n\}$ 
    endfor
  endfor
  for each variable  $a$  do
     $W := defsites[a]$ 
    while ( $W$  not empty) do
      remove some node  $n$  from  $W$ 
      for each  $Y$  in  $DF[n]$  do
        if ( $Y \notin \mathcal{D}_\phi[n]$ ) then
          insert statement  $a = \phi(a, \dots, a)$  at the top of  $Y$ 
           $\mathcal{D}_\phi[n] := \mathcal{D}_\phi[n] \cup \{Y\}$ 
          if ( $Y \notin \mathcal{D}[n]$ ) then  $W := W \cup \{Y\}$ 
        endif
      endfor
    endwhile
  endfor
```

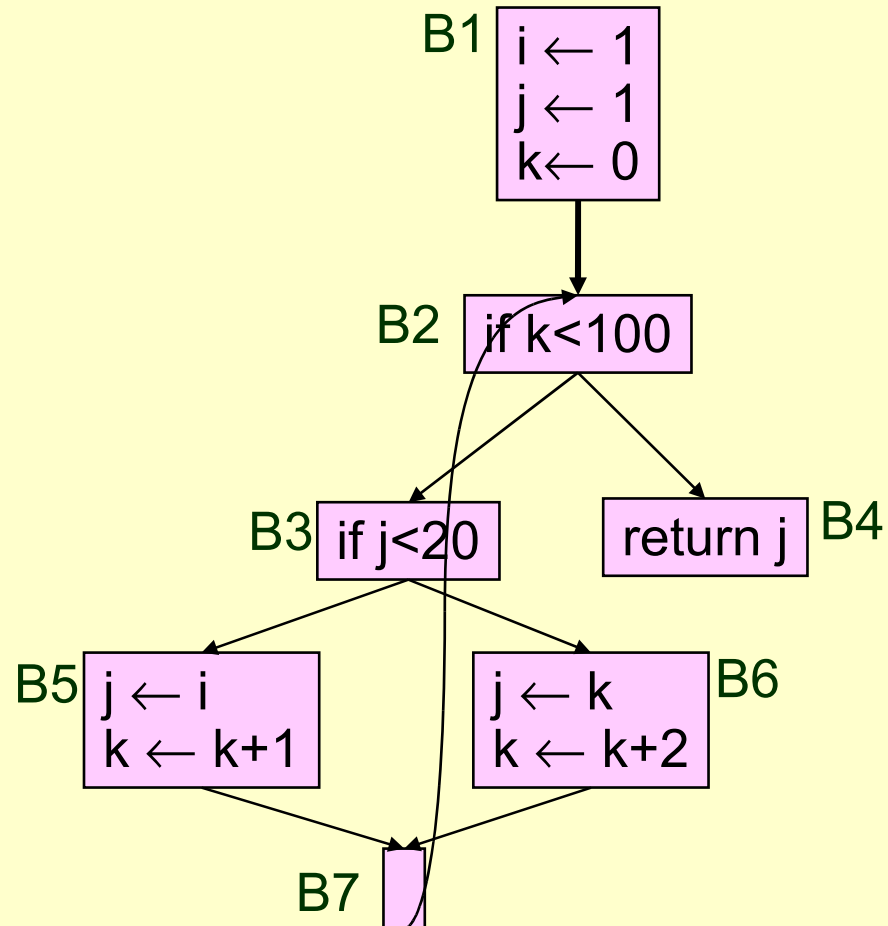

# Renaming variables

```
procedure Rename( $n$ )
  for each statement  $S$  in block  $n$  do
    if ( $S$  is not a  $\phi$ -function) then
      for each use of some variable  $x$  in  $S$  do
         $i := \text{top}(\text{Stack}[x])$ ; replace the use of  $x$  with  $x_i$  in  $S$ 
      endfor
    endif
    for each definition of some variable  $a$  in  $S$ 
       $\text{Count}[a] ++$ ;  $i := \text{Count}[a]$ ; push  $i$  onto  $\text{Stack}[a]$ ; replace definition with  $a_i$ 
    endfor
  endfor
  for each successor  $Y$  of block  $n$  and each  $\phi$ -function in  $Y$  do
     $i := \text{top}(\text{Stack}[a])$  where  $a$  is the argument coming from  $n$ ; replace it with  $a_i$ 
  endfor
  for each child (in the dominance tree)  $X$  of  $n$  do Rename( $X$ )
  for each definition of some variable  $a$  (in the original code) do pop  $\text{Stack}[a]$ 

procedure RenameAll( $G$ )
  for each variable  $a$  do  $\text{Count}[a] := 0$ ;  $\text{Stack}[a] := \{\}$ ; push 0 onto  $\text{Stack}[a]$ 
  Rename( $r$ ) /* root of the dominance tree */
```

# Example: Dead-code Elimination

# Constant Propagation and Dead Code Elimination

# Example: Is this the end?

But block 6 is never executed! How can we find this out, and simplify the program?

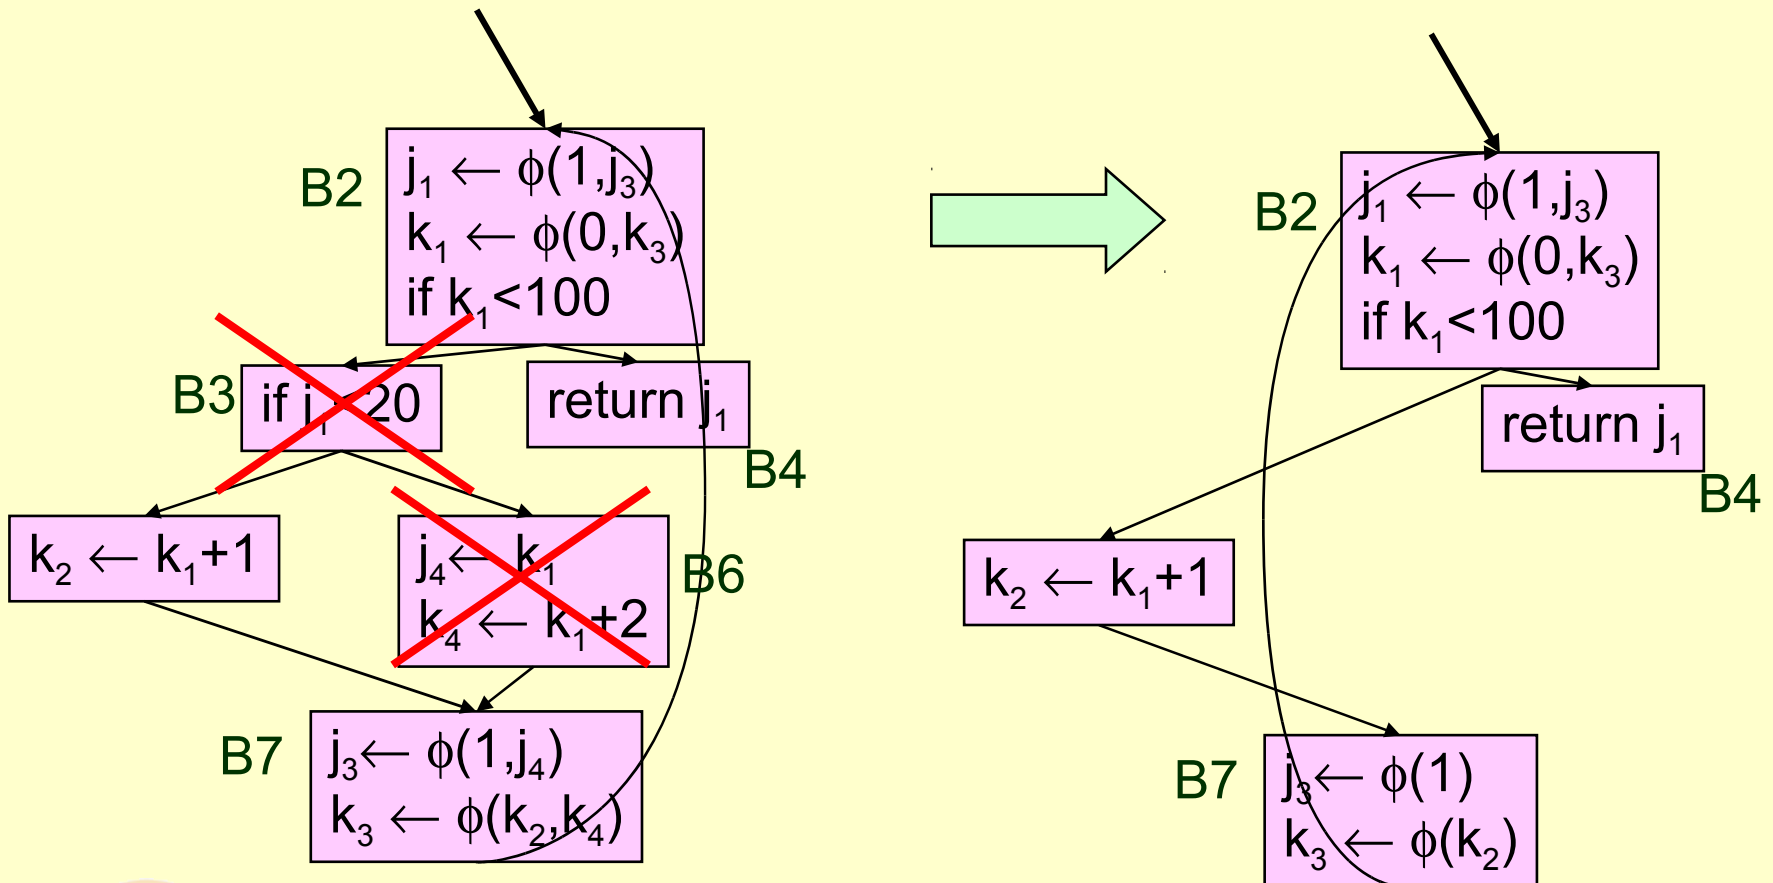

SSA conditional constant propagation finds the *least fixed point* for the program and allows further elimination of dead code.

See algorithm in Tiger book.

### Recent advances in SSA

- SSA-based compilers & JIT compilation.
- Register allocation, out-of-SSA conversion, liveness analysis.
- SSA extensions: SSI, gated SSA, psi-SSA, value state dependence graph, array SSA, safeTSA, etc.

# Links between the different notions

A few important results:

- If  $S$  contains the entry node,  $J(S) = J^+(S) = DF^+(S)$ .
- $G$  is reducible
  - iff simplifiable by the rules  $T_1$  and  $T_2$ .
  - iff each SCC has a unique entry node.
  - iff removing all  $(u, v)$  where  $v$  dominates  $u$  makes  $G$  acyclic.
  - ...
- Dominators and iterated dominance frontiers can be computed quickly from loop-nesting forest, especially if  $G$  is reducible.
- Conversely, DJ-graphs can be used to build loop forests.
- Advanced algorithms use Tarjan's union-find with almost-linear complexity (see Ramalingam, Sreedhar, Havlak, Steensgaard).

## Lost copy problem

☛ Many SSA optimizations turned off in gcc and Jikes.

## Going to CSSA (conventional SSA): Sreedhar et al.

### Definition (conventional SSA)

CSSA: if variables can be renamed, without changing program semantics, so that, for all  $\phi$ -function  $a_0 = \phi(a_1, \dots, a_n)$ ,  $a_0, \dots, a_n$  have the same name.

### From SSA to CSSA

## Going to CSSA (conventional SSA): Sreedhar et al.

### Definition (conventional SSA)

CSSA: if variables can be renamed, without changing program semantics, so that, for all  $\phi$ -function  $a_0 = \phi(a_1, \dots, a_n)$ ,  $a_0, \dots, a_n$  have the same name.

### Correctness

After introduction of variables  $a'_i$  and copies, the code is in CSSA.

### From SSA to CSSA

# Going to CSSA (conventional SSA): Sreedhar et al.

## Definition (conventional SSA)

CSSA: if variables can be renamed, without changing program semantics, so that, for all  $\phi$ -function  $a_0 = \phi(a_1, \dots, a_n)$ ,  $a_0, \dots, a_n$  have the same name.

## Correctness

After introduction of variables  $a'_i$  and copies, the code is in CSSA.

## Code quality

**Aggressive coalescing** can remove useless copies. But better use accurate notion of interferences.

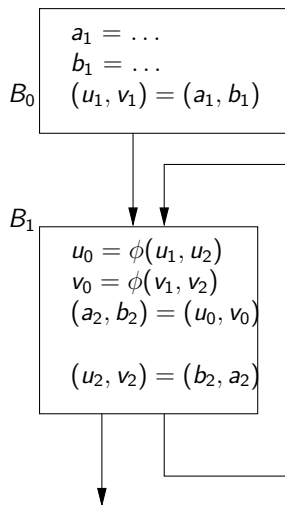

## From SSA to CSSA

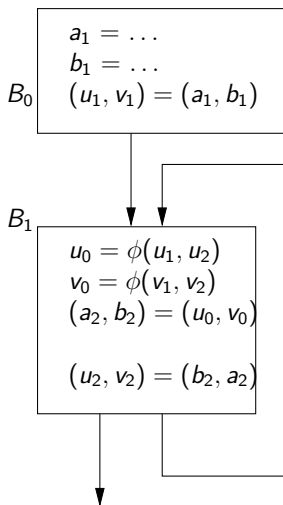

“Liveness of  $\phi$ ” defined by the  $a'_i$ .

† Be careful with potential bugs due to conditional branches that use or define variables.

## Using parallel copies instead of sequential copies

### Parallel copy semantics

In  $(a_1, \dots, a_n) = (b_1, \dots, b_n)$ , all copies  $a_i = b_i$  are simultaneous.

- Fewer interferences than with sequential copies.
- Easier insertion & liveness updates.
- But need to sequentialize.

## Using parallel copies instead of sequential copies

### Parallel copy semantics

In  $(a_1, \dots, a_n) = (b_1, \dots, b_n)$ , all copies  $a_i = b_i$  are simultaneous.

- Fewer interferences than with sequential copies.
- Easier insertion & liveness updates.
- But need to sequentialize.

### Particular copy structure

Directed graph with edges  $b_i \rightarrow a_i$ .

- Directed trees with roots=circuits.
- Insert copies for the leaves first.

$$(a, b, c, d) = (c, a, b, c)$$

# Using parallel copies instead of sequential copies

### Particular copy structure

Directed graph with edges  $b_i \rightarrow a_i$ .

- Directed trees with roots=circuits.
- Insert copies for the leaves first.
- Simple circuit: one more copy.

$d = c$   
 $c = b$   
 $b = a$   
 $a = d$

---

## Algorithm 1: Parallel copy sequentialization algorithm

---

**Data:** Set  $P$  of parallel copies  $a \mapsto b$ ,  $a \neq b$ , one extra fresh variable  $n$

**Output:** List of copies in sequential order

```
1 ready  $\leftarrow$  [] ; to_do  $\leftarrow$  [] ; pred( $n$ )  $\leftarrow$   $\perp$  ;
2 forall the  $(a \mapsto b) \in P$  do
3    $\lfloor$  loc( $b$ )  $\leftarrow$   $\perp$  ; pred( $a$ )  $\leftarrow$   $\perp$  ; /* initialization */
4 forall the  $(a \mapsto b) \in P$  do
5    $\lfloor$  loc( $a$ )  $\leftarrow$   $a$  ; pred( $b$ )  $\leftarrow$   $a$  ; to_do.push( $b$ ) ; /* copy into b to be done */
6 forall the  $(a \mapsto b) \in P$  do
7    $\lfloor$  if loc( $b$ ) =  $\perp$  then ready.push( $b$ ) ; /* b is not used and can be overwritten */
8 while to_do  $\neq$  [] do
9   while ready  $\neq$  [] do
10      $b \leftarrow$  ready.pop() ;  $a \leftarrow$  pred( $b$ ) ; /* pick a free location */
11      $c \leftarrow$  loc( $a$ ) ; emit_copy( $c \mapsto b$ ) ; loc( $a$ )  $\leftarrow$   $b$  ; /* generate the copy */
12     if  $a = c$  and pred( $a$ )  $\neq$   $\perp$  then ready.push( $a$ ) ; /* first time copied */
13      $b \leftarrow$  to_do.pop() ; /* look for remaining copy */
14     if  $b = \text{loc}(b)$  then
15        $\lfloor$  emit_copy( $b \mapsto n$ ) ; loc( $b$ )  $\leftarrow$   $n$  ; ready.push( $b$ ) ; /* break circuit */
```

---

# Qualitative experiments with SPEC CINT2000

## Key points of the out-of-SSA translation

- Copy insertion (to go to CSSA and to handle register renaming constraints) followed by coalescing.
- Value-based interferences → coalescing is improved and independent of virtualization (i.e., as in Sreedhar III).
- Parallel copies followed by sequentialization.

## Bug tracking RVM-254 of Jikes RVM

### Problems with SSA form: lack of loop unrolling breaks VM

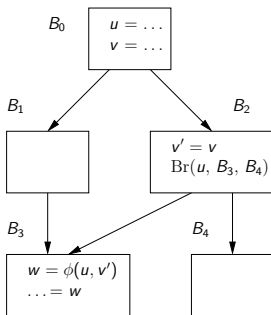

This problem is probably one of the most serious in the RVM currently. When loop unrolling is disabled and SSA enabled the created IR is corrupt. The error has in the past look like we were suffering from the "lost copy" problem, but implementing a naive solution to this didn't solve the problem. There is sound logic behind the code so we need to identify a small test case where things are broken and then reason about what's wrong in leave SSA. This has been attempted once (with the code that removes an element from the live set) but the problem no longer appears to surface here. Currently these optimizations are disabled but by RVM 3.0 they should be re-enable and this bug cured.
