### Goal

 The goal of this very technical lecture is to prove that L<sup>2</sup><sub>cusp</sub>(Γ\G) has a discrete decomposition for any lattice Γ in G = SL<sub>2</sub>(ℝ), and that cuspidal automorphic forms are rapidly decreasing near cusps.

### Goal

- The goal of this very technical lecture is to prove that L<sup>2</sup><sub>cusp</sub>(Γ\G) has a discrete decomposition for any lattice Γ in G = SL<sub>2</sub>(ℝ), and that cuspidal automorphic forms are rapidly decreasing near cusps.
- (II) This requires a very careful study of growth conditions on Γ\G, and the key ingredient is finding reasonable fundamental domains, or approximations of such things, for the action of Γ on ℋ.

If a group G acts on a topological space X, a fundamental domain for G acting on X is an open subset Ω ⊂ X such that X = ∪<sub>g∈G</sub>g.Ω and the various translates g.Ω are pairwise disjoint. The standard example is the following classical result (cf. any book on modular forms for the proof)

Theorem (Gauss) The set  $\mathscr{F} = \{z \in \mathbb{C} | |z| > 1, |\operatorname{Re}(z)| < 1/2\}$  is a fundamental domain for the action of  $\mathbb{SL}_2(\mathbb{Z})$  on  $\mathscr{H}$ .

One easily checks that  $\mathscr{F}$  has finite (hyperbolic) area, and this implies that  $\mathbb{SL}_2(\mathbb{Z})$  is indeed a lattice in G (something we never really checked before!).

(1) As an application, let's consider a finite index subgroup  $\Gamma$  in  $\mathbb{SL}_2(\mathbb{Z})$  and  $f \in M_k(\Gamma)$ . Then an immediate calculation shows that

$$\varphi_f: \mathscr{H} \to \mathbb{R}, \, z \to |f(z)| y^{k/2}$$

is  $\Gamma$ -invariant, more precisely  $\varphi_{f|_{k}g}(z) = f(g.z)$  for  $g \in G$ . We claim that  $\varphi_f$  is bounded when  $f \in S_k(\Gamma)$ .

(1) As an application, let's consider a finite index subgroup  $\Gamma$  in  $\mathbb{SL}_2(\mathbb{Z})$  and  $f \in M_k(\Gamma)$ . Then an immediate calculation shows that

$$\varphi_f:\mathscr{H}\to\mathbb{R},\,z\to|f(z)|y^{k/2}$$

is  $\Gamma$ -invariant, more precisely  $\varphi_{f|_{k}g}(z) = f(g.z)$  for  $g \in G$ . We claim that  $\varphi_f$  is bounded when  $f \in S_k(\Gamma)$ .

(II) Indeed, write  $\mathbb{SL}_2(\mathbb{Z}) = \coprod_{i=1}^k \Gamma \gamma_i$  and  $D = \overline{\mathscr{F}}$ , so that  $\mathscr{H} = \bigcup_i \bigcup_{\gamma \in \Gamma} \gamma \gamma_i D$ . Thus it suffices to check that  $\varphi_{f|_k \gamma_i}$  is bounded on D for all i.

(1) But  $f_i := f|_k \gamma_i \in S_k(\gamma_i^{-1} \Gamma \gamma_i)$  and the *q*-expansion at  $\infty$  shows that  $f_i(x + iy) = O(e^{-cy})$  for some c > 0, as  $y \to \infty$ , uniformly in  $z = x + iy \in D$ . Thus  $\varphi_{f_i}(z)$  tends to 0 as  $z \to \infty$  in D, so we are done.

Theorem (Hecke's bound) Let  $f(z) = \sum_{n\geq 0} a_n e^{2i\pi nz/h}$  be the *q*-expansion at  $\infty$  of  $f \in S_k(\Gamma)$ . Then  $a_n = O(n^{k/2})$ , more precisely

$$\sum_{n\leq x}|a_n|^2=O(x^k),\,x\to\infty.$$

(1) The proof is very simple: write  $|\varphi_f(z)| \le C$  for all z, so  $|f(x + iy)| \le Cy^{-k/2}$ . Plancherel's formula yields (for a suitable constant c)

$$\sum_{n \ge 1} |a_n|^2 e^{-4\pi ny/h} = c \int_0^h |f(x+iy)|^2 dx \le c' y^{-k}.$$
  
Take  $y = 1/N$  to get  $\sum_{n \le N} |a_n|^2 \le c'' N^k.$ 

Theorem We have  $S_0(\Gamma) = 0$  and  $M_0(\Gamma) = \mathbb{C}$ .

(1) The proof is very simple: write  $|\varphi_f(z)| \le C$  for all z, so  $|f(x + iy)| \le Cy^{-k/2}$ . Plancherel's formula yields (for a suitable constant c)

$$\sum_{n\geq 1} |a_n|^2 e^{-4\pi ny/h} = c \int_0^h |f(x+iy)|^2 dx \le c'y^{-k}.$$
  
Take  $y = 1/N$  to get  $\sum_{n\leq N} |a_n|^2 \le c'' N^k.$ 

Theorem We have  $S_0(\Gamma) = 0$  and  $M_0(\Gamma) = \mathbb{C}$ .

(II) If we use that X(Γ) is a compact Riemann surface, this is clear. Without this input, note that for f ∈ S<sub>0</sub>(Γ) the function φ<sub>f</sub> = |f| is bounded and tends to 0 at ∞, thus has a maximum on 𝔅. By the maximum principle f is constant and since f vanishes at ∞, f = 0. Actually the same argument works even if we only assume that f ∈ M<sub>0</sub>(Γ).

 Instead of working with fundamental domains, for automorphic needs Siegel sets are better behaved. These control the geometry at the cusps of X(Γ).

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

 Instead of working with fundamental domains, for automorphic needs Siegel sets are better behaved. These control the geometry at the cusps of X(Γ).

(II) Pick  $z \in \partial \mathscr{H}$  and let  $P = \pm A_P N_P = G_z$  be the associated parabolic of G. The action of  $A_P$  on  $\operatorname{Lie}(N_P)$  defines a character  $\alpha = \alpha_P : A_P \to \mathbb{R}_{>0}$ , thus  $aYa^{-1} = \alpha(a)Y$  for  $a \in A_P$  and  $Y \in \operatorname{Lie}(N_P)$ . If P = B is the standard Borel subgroup, then  $\alpha(\begin{pmatrix} t & 0 \\ 0 & t^{-1} \end{pmatrix}) = t^2$ . If t > 0, let  $A_{P,t} = \{a \in A_P | \alpha_P(a) > t\}$ .

 Instead of working with fundamental domains, for automorphic needs Siegel sets are better behaved. These control the geometry at the cusps of X(Γ).

$$\Sigma = \omega A_{P,t} K \subset G$$

for some t > 0 and some compact set  $\omega \subset N_P$ . The image of  $\Sigma$  in  $\mathscr{H} \simeq G/K$  is called a **Siegel set at** *z*.

 Let us make a few useful remarks. First, since N<sub>P</sub> × A<sub>P</sub> × K → G is a homeomorphism, any compact subset of G is contained in some Siegel set at P.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Let us make a few useful remarks. First, since
 N<sub>P</sub> × A<sub>P</sub> × K → G is a homeomorphism, any compact subset of G is contained in some Siegel set at P.

(II) Next, if 
$$z = \infty$$
 and  $\omega = \begin{pmatrix} 1 & [-c, c] \\ 0 & 1 \end{pmatrix}$  with  $c > 0$ , the associated Siegel set at z is

$$\Sigma = \{x + iy \in \mathscr{H} | |x| \le c, y > t\}.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Let us make a few useful remarks. First, since
 N<sub>P</sub> × A<sub>P</sub> × K → G is a homeomorphism, any compact subset of G is contained in some Siegel set at P.

(II) Next, if 
$$z = \infty$$
 and  $\omega = \begin{pmatrix} 1 & [-c, c] \\ 0 & 1 \end{pmatrix}$  with  $c > 0$ , the associated Siegel set at z is

$$\Sigma = \{x + iy \in \mathscr{H} | |x| \le c, y > t\}.$$

(III) If k ∈ K and Σ is a Siegel set for P, with fixed point z ∈ ∂ℋ then k.Σ is a Siegel set for kPk<sup>-1</sup>, with fixed point k.z, so we can always reduce to the previous situation.

Let z ∈ C(Γ) and π : ℋ ∪ C(Γ) → X(Γ) the natural projection. Using the previous remarks, one easily checks that sets of the form π({z} ∪ Σ) form a basis of neighborhoods of π(z) in X(Γ), when Σ varies among Siegel sets at z.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Let z ∈ C(Γ) and π : ℋ ∪ C(Γ) → X(Γ) the natural projection. Using the previous remarks, one easily checks that sets of the form π({z} ∪ Σ) form a basis of neighborhoods of π(z) in X(Γ), when Σ varies among Siegel sets at z.
- (II) Since  $\Gamma$  is a lattice in *G*, by Siegel's theorem  $\Gamma \setminus CP(\Gamma)$  is finite. Choose a set of representatives  $P_1, ..., P_l$  for this set.

Theorem There are Siegel sets  $\Sigma_i$  at  $P_i$  such that

$$G = \Gamma_{\bullet}(\cup_{i=1}^{l}\Sigma_{i}).$$

- Let z ∈ C(Γ) and π : ℋ ∪ C(Γ) → X(Γ) the natural projection. Using the previous remarks, one easily checks that sets of the form π({z} ∪ Σ) form a basis of neighborhoods of π(z) in X(Γ), when Σ varies among Siegel sets at z.
- (II) Since  $\Gamma$  is a lattice in *G*, by Siegel's theorem  $\Gamma \setminus CP(\Gamma)$  is finite. Choose a set of representatives  $P_1, ..., P_l$  for this set.

Theorem There are Siegel sets  $\Sigma_i$  at  $P_i$  such that  $G = \Gamma_{\bullet}(\cup_{i=1}^{l}\Sigma_i).$ 

(III) The proof follows easily from the compactness of  $X(\Gamma)$  and the previous geometric remarks.

 We will constantly use the following simple but useful result. Fix a Siegel set Σ at some parabolic P, and write x = n(x)a(x)k(x) with respect to the Iwasawa decomposition N<sub>P</sub> × A<sub>P</sub> × K ≃ G.

Lemma As x varies in  $\Sigma$ ,  $a(x)^{-1}x$  stays in a compact set and  $||x||^2$  behaves like  $\alpha_P(a(x))$ , i.e. there are constants  $c_1, c_2 > 0$  such that for all  $x \in \Sigma$ 

$$c_1 \leq \frac{||x||^2}{lpha_P(a(x))} \leq c_2.$$

(II) By conjugating, WLOG P = B, so that  $\alpha\begin{pmatrix} t & 0 \\ 0 & t^{-1} \end{pmatrix} = t^2$ .

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

(I) Write 
$$a(x) = \begin{pmatrix} t_x & 0\\ 0 & t_x^{-1} \end{pmatrix}$$
. Then  
 $a(x)^{-1}n(x)a(x) = \begin{pmatrix} 1 & u_x t_x^{-2}\\ 0 & 1 \end{pmatrix}$  if  $n_x = \begin{pmatrix} 1 & u_x\\ 0 & 1 \end{pmatrix}$ .

(I) Write 
$$a(x) = \begin{pmatrix} t_x & 0\\ 0 & t_x^{-1} \end{pmatrix}$$
. Then  
 $a(x)^{-1}n(x)a(x) = \begin{pmatrix} 1 & u_x t_x^{-2}\\ 0 & 1 \end{pmatrix}$  if  $n_x = \begin{pmatrix} 1 & u_x\\ 0 & 1 \end{pmatrix}$ 

(II) Since u<sub>x</sub> stays in a compact and t<sub>x</sub> is bounded from below on Σ, this gives the first part. For the second, by the first part ||x|| behaves like ||a(x)||, so it suffices to check that ||a(x)|| behaves like t<sub>x</sub>, which again follows from the fact that t<sub>x</sub> is bounded from below on Σ by definition.

If P ∈ CP(Γ) and Σ is a Siegel set at P, we say that
 f : Σ → C is moderate growth(resp rapidly decreasing) if
 there exists d ≥ 1 (resp. for all integers d) such that
 sup<sub>x∈Σ</sub> α(a(x))<sup>-d</sup>|f(x)| < ∞. By the previous lemma, one
 could replace α(a(x)) with ||x|| and get equivalent
 definitions.</p>

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- If P ∈ CP(Γ) and Σ is a Siegel set at P, we say that
   f : Σ → C is moderate growth(resp rapidly decreasing) if
   there exists d ≥ 1 (resp. for all integers d) such that
   sup<sub>x∈Σ</sub> α(a(x))<sup>-d</sup>|f(x)| < ∞. By the previous lemma, one
   could replace α(a(x)) with ||x|| and get equivalent
   definitions.</p>
- (II) The following result reduces many global problems to problems at individual cusps of  $X(\Gamma)$ . The proof is slightly tricky.

Theorem Let  $\Sigma_1, ..., \Sigma_i$  be Siegel sets such that  $\Gamma(\cup \Sigma_i) = G$ . A function f on  $\Gamma \setminus G$  has moderate growth on G if and only if f has moderate growth on each  $\Sigma_i$ .

(III) The only delicate part is showing that if f has MG on  $\Sigma_i$  for all i, then f has MG on G.

(1) So assume that  $|f(x)| \le c ||x||^N$  for  $x \in \bigcup_i \Sigma_i$ , for suitable c, N. Pick  $g \in G$  and write  $g = \gamma u$  for some  $u \in \Sigma_i$  and  $\gamma \in \Gamma$ . Then

$$|f(g)| = |f(u)| \le c||u||^N.$$

(II) So it suffices to check that  $||u|| \le c'||\gamma u||$  for all  $u \in \Sigma_i$  and  $\gamma \in \Gamma$ , for a suitable c'. By the useful lemma it suffices to have an estimate  $||a(x)|| \le c'||\gamma a(x)||$  for  $x \in \Sigma_i$ . Conjugating everything WLOG P = B. Write  $a(x) = \begin{pmatrix} t_x & 0 \\ 0 & t_x^{-1} \end{pmatrix}$  and  $\gamma = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$ . We need  $t_x^2 + 1/t_x^2 \le c''(t_x^2(a^2 + c^2) + (b^2 + d^2)/t_x^2)$ .

(1) So assume that  $|f(x)| \le c ||x||^N$  for  $x \in \bigcup_i \Sigma_i$ , for suitable c, N. Pick  $g \in G$  and write  $g = \gamma u$  for some  $u \in \Sigma_i$  and  $\gamma \in \Gamma$ . Then

$$|f(g)| = |f(u)| \le c||u||^N.$$

(II) So it suffices to check that  $||u|| \le c'||\gamma u||$  for all  $u \in \Sigma_i$  and  $\gamma \in \Gamma$ , for a suitable c'. By the useful lemma it suffices to have an estimate  $||a(x)|| \le c'||\gamma a(x)||$  for  $x \in \Sigma_i$ . Conjugating everything WLOG P = B. Write  $a(x) = \begin{pmatrix} t_x & 0\\ 0 & t_x^{-1} \end{pmatrix}$  and  $\gamma = \begin{pmatrix} a & b\\ c & d \end{pmatrix}$ . We need  $t_x^2 + 1/t_x^2 \le c''(t_x^2(a^2 + c^2) + (b^2 + d^2)/t_x^2)$ .

(III) Since  $t_x$  has a positive lower bound, we win if we can prove that c cannot be too small, unless it is 0 (we have already seen in the last lecture that if c = 0, then  $a^2 = 1$ ). This is clear when  $\Gamma \subset SL_2(\mathbb{Z})$ , but tricky in general.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

(I) Say 
$$\Gamma \cap \begin{pmatrix} 1 & \mathbb{R} \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & h\mathbb{Z} \\ 0 & 1 \end{pmatrix}$$
, we will show that if  $\gamma = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \Gamma$  satisfies  $|ch| < 1$ , then  $c = 0$ .

(I) Say 
$$\Gamma \cap \begin{pmatrix} 1 & \mathbb{R} \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & h\mathbb{Z} \\ 0 & 1 \end{pmatrix}$$
, we will show that if  $\gamma = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \Gamma$  satisfies  $|ch| < 1$ , then  $c = 0$ .

(II) Indeed, suppose that |ch| < 1 and define  $\gamma_0 = \gamma$  and  $\gamma_{n+1} = \gamma_n \begin{pmatrix} 1 & h \\ 0 & 1 \end{pmatrix} \gamma_n^{-1}$ , then an amusing real analysis exercise shows that  $\gamma_n \to \begin{pmatrix} 1 & h \\ 0 & 1 \end{pmatrix}$ . Since  $\Gamma$  is discrete,  $\gamma_n = \begin{pmatrix} 1 & h \\ 0 & 1 \end{pmatrix}$  for *n* large enough, and then easily c = 0.

### The first fundamental estimate

 We're going to use several times the following very effective estimate:

Theorem There is  $N \ge 1$  such that for all  $\alpha \in C_c^{\infty}(G)$ there is  $c_{\alpha} > 0$  with

$$|f * \alpha(x)| \leq c_{\alpha} ||x||^{N} \cdot ||f||_{L^{1}}, \forall f \in L^{1}(\Gamma \setminus G), x \in G.$$

In particular  $f * \alpha$  has moderate growth for any  $\alpha \in C_c^{\infty}(G)$ and  $f \in L^1(\Gamma \setminus G)$ , with uniform exponent!

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

### The first fundamental estimate

 We're going to use several times the following very effective estimate:

Theorem There is  $N \ge 1$  such that for all  $\alpha \in C_c^{\infty}(G)$ there is  $c_{\alpha} > 0$  with

$$|f * \alpha(x)| \leq c_{\alpha}||x||^{N} \cdot ||f||_{L^{1}}, \forall f \in L^{1}(\Gamma \setminus G), x \in G.$$

In particular  $f * \alpha$  has moderate growth for any  $\alpha \in C_c^{\infty}(G)$ and  $f \in L^1(\Gamma \setminus G)$ , with uniform exponent!

(II) By the usual trick we have, with  $K(x,y) = \sum_{\gamma \in \Gamma} |lpha(y^{-1}\gamma x)|$ 

$$|(f*\alpha)(x)| \leq \int_{\mathcal{G}} |f(y)|| \alpha(y^{-1}x)| dy = \int_{\Gamma \setminus \mathcal{G}} |f(y)| \mathcal{K}(x,y) dy.$$

#### The first fundamental estimate

(1) It suffices therefore to have a bound  $K(x, y) \leq c||x||^N$  with c depending only on  $\alpha$ , not on f and x. But if  $U = \text{Supp}(\alpha)$  (a compact set), then

$$\mathcal{K}(x,y) \leq ||\alpha||_{\infty} \sum_{\gamma \in \Gamma} \mathbf{1}_{y^{-1}\gamma x \in U}$$

and we saw in the previous lecture that this is bounded uniformly by  $c||x||^N$ .

#### The second fundamental estimate

(1) The key technical result of this lecture is the following rather awful-looking statement. Fix P ∈ CP(Γ), and let N = N<sub>P</sub> and Γ<sub>N</sub> = Γ ∩ N. Recall that for u ∈ C(Γ<sub>N</sub>\G) the constant term at P is

$$u(g) = \int_{\Gamma_N \setminus N} u(ng) dn.$$

Theorem (second fundamental estimate) Let  $\Sigma$  be a Siegel set at P. For any  $d \ge 1$  there are  $D_1, ..., D_k \in U(\mathfrak{g})$  such that for all  $f \in C^{\infty}(\Gamma_N \setminus G)$ ,  $x \in \Sigma$ 

$$|f(x) - f_P(x)| \le ||x||^{-d} \sum_{i=1}^k |D_i f|_P(x).$$

### The second fundamental estimate

(1) So f is very well approximated on Siegel sets by the constant term of f and those of |Df| with  $D \in U(\mathfrak{g})$ .

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

### The second fundamental estimate

- (1) So f is very well approximated on Siegel sets by the constant term of f and those of |Df| with  $D \in U(\mathfrak{g})$ .
- (II) We leave the proof for the end of the lecture, and focus on the applications first. Keep P and  $\Sigma$  as in the theorem.

### Cusp forms are rapidly decreasing

(I) Using the previous results, we are ready to prove the fundamental:

Theorem Let  $\Sigma$  be a Siegel set at some  $P \in CP(\Gamma)$ . Any  $f \in A_{cusp}(\Gamma)$  is rapidly decreasing on  $\Sigma$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

### Cusp forms are rapidly decreasing

(I) Using the previous results, we are ready to prove the fundamental:

Theorem Let  $\Sigma$  be a Siegel set at some  $P \in CP(\Gamma)$ . Any  $f \in A_{cusp}(\Gamma)$  is rapidly decreasing on  $\Sigma$ .

(II) We saw in the last lecture that f has uniform moderate growth, i.e. there is N such that for all  $D \in U(\mathfrak{g})$  we have  $|Df(g)| \leq c_D ||g||^N$  for all g. This allows us to bound  $|D_i f(g)| \leq c ||g||^N$  with  $D_i$  as in the second fundamental estimate (for a given  $d \geq 1$ ). Since  $\Gamma_N \setminus N$  is compact, this gives an estimate  $|D_i f|_P(x) \leq c ||x||^N$  for  $x \in \Sigma$  and thus

$$|f(x)| \le c||x||^{N-d}$$

・ロト・日本・モート モー うへで

on  $\Sigma$ . Since N is fixed and d is arbitrary, we are done.

 For this lecture, the most important application of all previous results is the following technical but useful:

Theorem For any  $\alpha \in C_c^{\infty}(G)$  there is  $c_{\alpha}$  such that for all  $f \in L^2_{cusp}(\Gamma \setminus G)$  and all  $g \in G$ 

$$||f * \alpha||_{\infty} \leq c_{\alpha} ||f||_{L^{2}(\Gamma \setminus G)}.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

 For this lecture, the most important application of all previous results is the following technical but useful:

Theorem For any  $\alpha \in C_c^{\infty}(G)$  there is  $c_{\alpha}$  such that for all  $f \in L^2_{cusp}(\Gamma \setminus G)$  and all  $g \in G$ 

$$||f * \alpha||_{\infty} \leq c_{\alpha} ||f||_{L^{2}(\Gamma \setminus G)}.$$

(II) Since  $\Gamma \setminus G$  is covered by finitely many Siegel sets at cuspidal parabolic subgroups, it is enough to prove the lemma with g varying in a given Siegel set  $\Sigma$  at  $P \in CP(\Gamma)$ .

(I) Fix now  $\alpha \in C^{\infty}_{c}(G)$ . A simple computation shows that

$$(f * \alpha)_P = f_P * \alpha = 0.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

On the other hand  $D_i(f * \alpha) = f * (D_i \alpha)$ .

(I) Fix now  $\alpha \in C^{\infty}_{c}(G)$ . A simple computation shows that

$$(f * \alpha)_P = f_P * \alpha = 0$$

On the other hand  $D_i(f * \alpha) = f * (D_i \alpha)$ .

(II) Now pick  $N \ge 1$  so that (first fundamental estimate) for any  $\beta \in C_c^{\infty}(G)$  we have

$$\sup_{x \in G, f \in L^1(\Gamma \setminus G)} \frac{|(f * \beta)(x)|}{||x||^{N_{\bullet}} ||f||_{L^1}} < \infty.$$
(1)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

(1) Combining the previous observations with the second fundamental estimate (applied to  $f * \alpha$  and d = N) yields  $D_1, ..., D_k \in U(\mathfrak{g})$  so that for all  $x \in \Sigma$ 

$$|f * \alpha(x)| \le ||x||^{-N} \sum_{i=1}^{k} |f * (D_i \alpha)|_P(x)$$
 (2).

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

 Combining the previous observations with the second fundamental estimate (applied to f \* α and d = N) yields D<sub>1</sub>,..., D<sub>k</sub> ∈ U(g) so that for all x ∈ Σ

$$|f * \alpha(x)| \le ||x||^{-N} \sum_{i=1}^{k} |f * (D_i \alpha)|_P(x)$$
 (2).

(II) Taking  $\beta = D_i \alpha$  in (1) yields c so that for all  $f \in L^1(\Gamma \setminus G)$ and  $1 \le i \le k$  we have  $|f * (D_i \alpha)(x)| \le c_i ||x||^N ||f||_{L^1}$  for all  $x \in G$ . Since  $L^2 \subset L^1$  is a continuous injection (Cauchy-Schwarz coupled with  $\int_{\Gamma \setminus G} dg < \infty$ ), it follows that there is c such that for all  $f \in L^2$  and all i and  $x \in G$ 

$$|f * (D_i \alpha)(x)| \leq c ||x||^N ||f||_{L^2}.$$

(1) Combining the previous observations with the second fundamental estimate (applied to  $f * \alpha$  and d = N) yields  $D_1, ..., D_k \in U(\mathfrak{g})$  so that for all  $x \in \Sigma$ 

$$|f * \alpha(x)| \le ||x||^{-N} \sum_{i=1}^{k} |f * (D_i \alpha)|_P(x)$$
 (2).

(II) Taking  $\beta = D_i \alpha$  in (1) yields c so that for all  $f \in L^1(\Gamma \setminus G)$ and  $1 \leq i \leq k$  we have  $|f * (D_i \alpha)(x)| \leq c_i ||x||^N ||f||_{L^1}$  for all  $x \in G$ . Since  $L^2 \subset L^1$  is a continuous injection (Cauchy-Schwarz coupled with  $\int_{\Gamma \setminus G} dg < \infty$ ), it follows that there is c such that for all  $f \in L^2$  and all i and  $x \in G$ 

$$|f * (D_i \alpha)(x)| \leq c ||x||^N ||f||_{L^2}.$$

(III) Again the compactness of  $\Gamma_N \setminus N$  yields an estimate  $|D_i f|_P(x) \le C ||x||^N$  for  $x \in \Sigma$  and we are done thanks to (2).

(1) Recall that  $C_c^{\infty}(G)$  acts on any object  $V \in \text{Rep}(G)$  by  $f.v = \int_G f(g)g.vdg$  and when V is a space of functions on G, the induced operator  $T_f : \varphi \to f.\varphi$  is simply  $f * \varphi$ .

Theorem (Gelfand, Graev, Piatetski-Shapiro) For any  $\alpha \in C_c^{\infty}(G)$  the operator  $T_{\alpha}$  is Hilbert-Schmidt, thus compact on  $L^2_{cusp}(\Gamma \setminus G)$ . Hence  $L^2_{cusp}(\Gamma \setminus G)$  has a discrete decomposition

$$L^2_{\mathrm{cusp}}(\Gamma \backslash G) \simeq \widehat{\bigoplus}_{\pi \in \hat{G}} \pi \otimes \mathrm{Hom}_G(\pi, L^2_{\mathrm{cusp}}(\Gamma \backslash G))$$

with  $\operatorname{Hom}_{G}(\pi, L^{2}_{\operatorname{cusp}}(\Gamma \setminus G))$  finite dimensional vector spaces.

Combining this with the Dixmier-Malliavin theorem, it follows that  $T_{\alpha}$  is actually of trace class.

(1) The previous theorem combined with Riesz' theorem show that for any  $g \in \Gamma \setminus G$  there is  $K_g \in L^2_{cusp}$  with  $T_{\alpha}(f)(g) = \langle f, K_g \rangle$  for all  $f \in L^2_{cusp}$ . Moreover  $||K_g||_{L^2} \leq c_{\alpha}$ , thus  $g \to K_g$  is bounded. The tricky thing is that we don't know that setting  $K(g, x) = K_g(x)$  gives a measurable function.

- (1) The previous theorem combined with Riesz' theorem show that for any  $g \in \Gamma \setminus G$  there is  $K_g \in L^2_{cusp}$  with  $T_{\alpha}(f)(g) = \langle f, K_g \rangle$  for all  $f \in L^2_{cusp}$ . Moreover  $||K_g||_{L^2} \leq c_{\alpha}$ , thus  $g \to K_g$  is bounded. The tricky thing is that we don't know that setting  $K(g, x) = K_g(x)$  gives a measurable function.
- (II) We prove first that  $\Gamma \setminus G \to L^2_{cusp}, g \to K_g$  is continuous. Fix g and  $\varepsilon > 0$ . We need to show that

$$|T_{lpha}(f)(g) - T_{lpha}(f)(g')| \leq arepsilon ||f||_{L^2}$$

for all  $f \in L^2_{cusp}$  if g' is close enough to g.

(I) It suffices for this to have a bound for each  $X \in \mathfrak{g}$ 

 $||X.T_{\alpha}(f)||_{\infty} \leq c_X ||f||_{L^2}$ 

with  $c_X$  independent of f. But  $X.T_{\alpha}(f) = X.(f * \alpha) = f * (X.\alpha)$ , so it suffices to apply the previous theorem to  $X\alpha \in C_c^{\infty}(G)$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

(1) It suffices for this to have a bound for each  $X\in\mathfrak{g}$ 

 $||X.T_{\alpha}(f)||_{\infty} \leq c_X ||f||_{L^2}$ 

with  $c_X$  independent of f. But  $X.T_{\alpha}(f) = X.(f * \alpha) = f * (X.\alpha)$ , so it suffices to apply the previous theorem to  $X\alpha \in C_c^{\infty}(G)$ .

(II) Since  $g \to K_g$  is continuous and bounded, we can define a continuous linear form on  $L^2(\Gamma \setminus G \times \Gamma \setminus G)$  by

$$U(\varphi) := \int_{\Gamma \setminus G} \langle \varphi(g, \bullet), \mathcal{K}_g \rangle dg,$$

where  $\varphi(g, \bullet) : x \to \varphi(g, x)$  (by Fubini  $g \to \varphi(g, \bullet)$  is in  $L^2(\Gamma \setminus G, L^2(\Gamma \setminus G))$ , so U is well-defined).

Applying Riesz we obtain some K' ∈ L<sup>2</sup>(Γ\G × Γ\G) such that U(φ) = ⟨φ, K'⟩ for all φ. Taking φ(x, y) = u(x)f(y) with u ∈ C<sup>∞</sup><sub>c</sub>(Γ\G) and expanding everything yields

$$\int_{\Gamma \setminus G} u(g) T_{\alpha}(f)(g) = \int_{\Gamma \setminus G} \langle u(g) f, K_g \rangle dg =$$

$$\int_{\Gamma \setminus G} \langle \varphi(g, \bullet), K_g \rangle dg = \int_{\Gamma \setminus G \times \Gamma \setminus G} u(g) f(y) \overline{K'(g, y)} dy = \int_{\Gamma \setminus G} u(g) (\int_{\Gamma \setminus G} f(y) \overline{K'(g, y)} dy) dg.$$

Applying Riesz we obtain some K' ∈ L<sup>2</sup>(Γ\G × Γ\G) such that U(φ) = ⟨φ, K'⟩ for all φ. Taking φ(x, y) = u(x)f(y) with u ∈ C<sup>∞</sup><sub>c</sub>(Γ\G) and expanding everything yields

$$\int_{\Gamma \setminus G} u(g) \mathcal{T}_{lpha}(f)(g) = \int_{\Gamma \setminus G} \langle u(g) f, \mathcal{K}_g 
angle dg =$$

$$\begin{split} \int_{\Gamma \setminus G} \langle \varphi(g, \bullet), K_g \rangle dg &= \int_{\Gamma \setminus G \times \Gamma \setminus G} u(g) f(y) \overline{K'(g, y)} dy = \\ &\int_{\Gamma \setminus G} u(g) (\int_{\Gamma \setminus G} f(y) \overline{K'(g, y)} dy) dg. \end{split}$$

(II) Varying u finally exhibits exhibits  $T_{\alpha}$  as a HS operator

$$T_{\alpha}(f)(x) = \int_{\Gamma \setminus G} f(y) \overline{K'(x,y)} dy.$$

 Fix P ∈ CP(Γ) and write for simplicity A := A<sub>P</sub> and N := N<sub>P</sub>. Recall the character α = α<sub>P</sub> : A → ℝ<sub>>0</sub> such that aYa<sup>-1</sup> = α(a)Y for Y ∈ Lie(N), and that N × A × K → G is a diffeomorphism, so we can write x = n(x)a(x)k(x) with n(x) ∈ N, a(x) ∈ A, k(x) ∈ K.

 Fix P ∈ CP(Γ) and write for simplicity A := A<sub>P</sub> and N := N<sub>P</sub>. Recall the character α = α<sub>P</sub> : A → ℝ<sub>>0</sub> such that aYa<sup>-1</sup> = α(a)Y for Y ∈ Lie(N), and that N × A × K → G is a diffeomorphism, so we can write x = n(x)a(x)k(x) with n(x) ∈ N, a(x) ∈ A, k(x) ∈ K.

(II) Since  $N \simeq \mathbb{R}$  we can find  $Y \in \text{Lie}(N)$  such that  $N = \exp(\mathbb{R}Y)$  and  $\Gamma_N = \exp(\mathbb{Z}Y)$ .

(I) Fix P ∈ CP(Γ) and write for simplicity A := A<sub>P</sub> and N := N<sub>P</sub>. Recall the character α = α<sub>P</sub> : A → ℝ<sub>>0</sub> such that aYa<sup>-1</sup> = α(a)Y for Y ∈ Lie(N), and that N × A × K → G is a diffeomorphism, so we can write x = n(x)a(x)k(x) with n(x) ∈ N, a(x) ∈ A, k(x) ∈ K.

(II) Since 
$$N \simeq \mathbb{R}$$
 we can find  $Y \in \text{Lie}(N)$  such that  $N = \exp(\mathbb{R}Y)$  and  $\Gamma_N = \exp(\mathbb{Z}Y)$ .

(III) Fix  $x \in \Sigma$  and consider the smooth 1-periodic map  $u(t) = f(e^{tY}x)$ .

(1) Note that f(x) = u(0) and

$$f_P(x) = \int_{\Gamma_N \setminus N} f(nx) dn = \int_{\mathbb{Z} \setminus \mathbb{R}} f(e^{tY}x) dt = \int_0^1 u(t) dt.$$

(1) Note that f(x) = u(0) and

$$f_P(x) = \int_{\Gamma_N \setminus N} f(nx) dn = \int_{\mathbb{Z} \setminus \mathbb{R}} f(e^{tY}x) dt = \int_0^1 u(t) dt.$$

(II) We claim that

$$|u(0) - \int_0^1 u(t)dt| \leq \int_0^1 |u^{(d)}(t)|dt.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

(1) Note that f(x) = u(0) and

$$f_P(x) = \int_{\Gamma_N \setminus N} f(nx) dn = \int_{\mathbb{Z} \setminus \mathbb{R}} f(e^{tY}x) dt = \int_0^1 u(t) dt.$$

(II) We claim that

$$|u(0) - \int_0^1 u(t) dt| \leq \int_0^1 |u^{(d)}(t)| dt.$$

(III) Replacing u by u - u(0), WLOG u(0) = 0, so u(1) = 0. Now use repeated integrations by parts to get

$$|\int_0^1 u(t)dt| = |\pm \int_0^1 \frac{t^d}{d!} u^{(d)}(t)dt| \le \frac{1}{d!} \int_0^1 |u^{(d)}(t)|dt.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○○

(I) Next, we compute

$$u'(t) = \frac{d}{du}|_{u=0} f(e^{tY}xx^{-1}e^{uY}x) =$$
$$\frac{d}{du}|_{u=0} f(e^{tY}xe^{u(x^{-1}Yx)}) = ((x^{-1}Yx).f)(e^{tY}x)$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

and iterating, we obtain  $u^{(d)}(t) = (D_x f)(e^{tY}x)$ , where  $D_x = (x^{-1}Yx)^d \in U(\mathfrak{g})$ .

(I) Next, we compute

$$u'(t) = \frac{d}{du}|_{u=0}f(e^{tY}xx^{-1}e^{uY}x) =$$
$$\frac{d}{du}|_{u=0}f(e^{tY}xe^{u(x^{-1}Yx)}) = ((x^{-1}Yx).f)(e^{tY}x)$$

and iterating, we obtain  $u^{(d)}(t) = (D_x f)(e^{tY}x)$ , where  $D_x = (x^{-1}Yx)^d \in U(\mathfrak{g})$ .

(II) By the very useful lemma on Siegel sets we can write x = a(x)y(x), with y(x) in a compact set, and by definition of  $\alpha$  we obtain

$$D_x = \alpha(a(x))^{-d}(y(x)^{-1}Yy(x))^d.$$

(1) Take a basis  $D_i$   $(1 \le i \le k)$  of the subspace of  $U(\mathfrak{g})$  spanned by all  $X_1...X_d$  with  $X_i \in \mathfrak{g}$ . Then

$$(y(x)^{-1}Yy(x))^d = \sum_{i=1}^k a_i(y(x))D_i,$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

with  $a_i(y(x))$  bounded (by continuity) as x varies in  $\Sigma$ .

(1) Take a basis  $D_i$   $(1 \le i \le k)$  of the subspace of  $U(\mathfrak{g})$  spanned by all  $X_1...X_d$  with  $X_i \in \mathfrak{g}$ . Then

$$(y(x)^{-1}Yy(x))^d = \sum_{i=1}^k a_i(y(x))D_i,$$

with  $a_i(y(x))$  bounded (by continuity) as x varies in  $\Sigma$ . (II) Hence there is c such that for all f and  $x \in \Sigma$ 

$$|(D_x.f)(e^{tY}x)| \leq c\alpha(a(x))^{-d}\sum_{i=1}^k |D_i.f(e^{tY}x)|.$$

Putting everything together we get

$$|(f-f_P)(x)| \leq c \alpha(a(x))^{-d} \sum_{i=1}^k \int_{\Gamma_N \setminus N} |D_i.f(nx)| dn.$$

(1) Take a basis  $D_i$   $(1 \le i \le k)$  of the subspace of  $U(\mathfrak{g})$  spanned by all  $X_1...X_d$  with  $X_i \in \mathfrak{g}$ . Then

$$(y(x)^{-1}Yy(x))^d = \sum_{i=1}^k a_i(y(x))D_i,$$

with  $a_i(y(x))$  bounded (by continuity) as x varies in  $\Sigma$ . (II) Hence there is c such that for all f and  $x \in \Sigma$ 

$$|(D_x.f)(e^{tY}x)| \leq c\alpha(a(x))^{-d}\sum_{i=1}^k |D_i.f(e^{tY}x)|.$$

Putting everything together we get

$$|(f-f_P)(x)| \leq c\alpha(a(x))^{-d} \sum_{i=1}^k \int_{\Gamma_N \setminus N} |D_i.f(nx)| dn.$$

(III) We conclude recalling that  $\alpha(a(x))$  is approximately  $||x||^2$  on  $\Sigma$ , and  $||x|| \ge 1$  for all x.

### Problem set

(I)  $\Gamma$  will always be a lattice in  $G = \mathbb{SL}_2(\mathbb{R})$ .

#### Problem set

(I)  $\Gamma$  will always be a lattice in  $G = \mathbb{SL}_2(\mathbb{R})$ .

(II) Let Σ<sub>i</sub> be Siegel sets at a set of representatives P<sub>i</sub> of Γ\C(Γ), such that Γ(∪<sub>i</sub>Σ<sub>i</sub>) = G. Let f ∈ A(Γ) be an automorphic form such that f<sub>Pi</sub> ∈ L<sup>2</sup>(Σ<sub>i</sub>) for all i. Prove that f ∈ L<sup>2</sup>(Γ\G).

### Problem set
