Dynamic Data-Structures

Distribution sweeping for geometric problem

Conclusion

# Motivation for Cache-Oblivious Algorithms

I/O-optimal algorithms in the **external memory** model:

Depend on the memory parameters  $B$  and  $M$ : **cache-aware**

- ▶ Blocked-Matrix-Product: block size  $b = \sqrt{M}/3$
- ▶ Merge-Sort:  $K = M/B - 1$
- ▶ B-Trees: degree of a node in  $O(B)$

Goal: design I/O-optimal algorithms that do not know  $M$  and  $B$

- ▶ Self-tuning
- ▶ Optimal for any value of cache parameters  
→ optimal for any level of the cache hierarchy!

Cache-Oblivious model:

- ▶ Ideal-cache model
- ▶ No explicit operations on blocks as in external memory algos.

# Outline

## Cache Oblivious Algorithms and Data Structures

Motivation

**Divide and Conquer**

Static Search Trees

Cache-Oblivious Sorting: Funnels

Dynamic Data-Structures

Distribution sweeping for geometric problem

Conclusion

# Main Tool: Divide and Conquer

Major tool:

- ▶ Split problem into smaller sizes
- ▶ At some point, size gets smaller than the cache size: no I/O needed for next recursive calls
- ▶ Analyse I/O for these “leaves” of the recursion tree and divide/merge operations

Example: Recursive matrix multiplication:

$$A = \left( \begin{array}{c|c} A_{1,1} & A_{1,2} \\ \hline A_{2,1} & A_{2,2} \end{array} \right) B = \left( \begin{array}{c|c} B_{1,1} & B_{1,2} \\ \hline B_{2,1} & B_{2,2} \end{array} \right) C = \left( \begin{array}{c|c} C_{1,1} & C_{1,2} \\ \hline C_{2,1} & C_{2,2} \end{array} \right)$$

- ▶ If  $N > 1$ , compute:

$$C_{1,1} = \text{RecMatMult}(A_{1,1}, B_{1,1}) + \text{RecMatMult}(A_{1,2}, B_{2,1})$$

$$C_{1,2} = \text{RecMatMult}(A_{1,1}, B_{1,2}) + \text{RecMatMult}(A_{1,2}, B_{2,2})$$

$$C_{2,1} = \text{RecMatMult}(A_{2,1}, B_{1,1}) + \text{RecMatMult}(A_{2,2}, B_{2,1})$$

$$C_{2,2} = \text{RecMatMult}(A_{2,1}, B_{1,2}) + \text{RecMatMult}(A_{2,2}, B_{2,2})$$

- ▶ Base case: multiply elements

# Main Tool: Divide and Conquer

Major tool:

- ▶ Split problem into smaller sizes
- ▶ At some point, size gets smaller than the cache size:  
no I/O needed for next recursive calls
- ▶ Analyse I/O for these “leaves” of the recursion tree  
and divide/merge operations

Example: Recursive matrix multiplication:

$$A = \left( \begin{array}{c|c} A_{1,1} & A_{1,2} \\ \hline A_{2,1} & A_{2,2} \end{array} \right) B = \left( \begin{array}{c|c} B_{1,1} & B_{1,2} \\ \hline B_{2,1} & B_{2,2} \end{array} \right) C = \left( \begin{array}{c|c} C_{1,1} & C_{1,2} \\ \hline C_{2,1} & C_{2,2} \end{array} \right)$$

- ▶ If  $N > 1$ , compute:

$$C_{1,1} = \text{RecMatMult}(A_{1,1}, B_{1,1}) + \text{RecMatMult}(A_{1,2}, B_{2,1})$$

$$C_{1,2} = \text{RecMatMult}(A_{1,1}, B_{1,2}) + \text{RecMatMult}(A_{1,2}, B_{2,2})$$

$$C_{2,1} = \text{RecMatMult}(A_{2,1}, B_{1,1}) + \text{RecMatMult}(A_{2,2}, B_{2,1})$$

$$C_{2,2} = \text{RecMatMult}(A_{2,1}, B_{1,2}) + \text{RecMatMult}(A_{2,2}, B_{2,2})$$

- ▶ Base case: multiply elements

## Recursive Matrix Multiply: Analysis

$$C_{1,1} = \text{RecMatMult}(A_{1,1}, B_{1,1}) + \text{RecMatMult}(A_{1,2}, B_{2,1})$$

$$C_{1,2} = \text{RecMatMult}(A_{1,1}, B_{1,2}) + \text{RecMatMult}(A_{1,2}, B_{2,2})$$

$$C_{2,1} = \text{RecMatMult}(A_{2,1}, B_{1,1}) + \text{RecMatMult}(A_{2,2}, B_{2,1})$$

$$C_{2,2} = \text{RecMatMult}(A_{2,1}, B_{1,2}) + \text{RecMatMult}(A_{2,2}, B_{2,2})$$

- ▶ 8 recursive calls on matrices of size  $N/2 \times N/2$
- ▶ Number of I/O for size  $N \times N$ :  $T(N) = 8T(N/2)$
- ▶ Base case for the analysis: when 3 blocks fit in the cache ( $3N^2 \leq M$ )  
no more I/O for smaller sizes, then

$$T(N) = O(N^2/B) = O(M/B)$$

- ▶ No cost on merge, all I/O cost on leaves
- ▶ Height of the recursive call tree:  $h = \log_2(N/(\sqrt{M}/3))$
- ▶ Total I/O cost:

$$T(N) = O(8^h M/B) = O(N^3/(B\sqrt{M}))$$

- ▶ Same performance as blocked algorithm!
- ▶ What if we choose  $3N^2 = B$  as base case?
- ▶ If I/Os not only on leaves: use Master Theorem for divide-and-conquer recurrences

## Recursive Matrix Multiply: Analysis

*RecMatMultAdd*( $A_{1,1}$ ,  $B_{1,1}$ ,  $C_{1,1}$ ); *RecMatMultAdd*( $A_{1,2}$ ,  $B_{2,1}$ ,  $C_{1,1}$ )  
*RecMatMultAdd*( $A_{1,1}$ ,  $B_{1,2}$ ,  $C_{1,2}$ ); *RecMatMultAdd*( $A_{1,2}$ ,  $B_{2,2}$ ,  $C_{1,2}$ )  
*RecMatMultAdd*( $A_{2,1}$ ,  $B_{1,1}$ ,  $C_{2,1}$ ); *RecMatMultAdd*( $A_{2,2}$ ,  $B_{2,1}$ ,  $C_{2,1}$ )  
*RecMatMultAdd*( $A_{2,1}$ ,  $B_{1,2}$ ,  $C_{2,2}$ ); *RecMatMultAdd*( $A_{2,2}$ ,  $B_{2,2}$ ,  $C_{2,2}$ )

## Recursive Matrix Layout

NB: previous analysis need **tall-cache** assumption ( $M \geq B^2$ ) ! If not, use recursive layout, e.g. bit-interleaved layout:

## Recursive Matrix Layout

NB: previous analysis need **tall-cache** assumption ( $M \geq B^2$ ) ! If not, use recursive layout, e.g. bit-interleaved layout:

# Recursive Matrix Layout

NB: previous analysis need **tall-cache** assumption ( $M \geq B^2$ ) ! If not, use recursive layout, e.g. bit-interleaved layout:

	$x^2$	0	1	2	3	4	5	6	7
		000	001	010	011	100	101	110	111
$y^2$	0	000000	000001	000100	000101	010000	010001	010100	010101
	1	000010	000011	000110	000111	010010	010011	010110	010111
	2	001000	001001	001100	001101	011000	011001	011100	011101
	3	001010	001011	001110	001111	011010	011011	011110	011111
	4	100000	100001	100100	100101	110000	110001	110100	110101
	5	100010	100011	100110	100111	110010	110011	110110	110111
	6	101000	101001	101100	101101	111000	111001	111100	111101
	7	101010	101011	101110	101111	111010	111011	111110	111111

## Recursive Matrix Layout

NB: previous analysis need **tall-cache** assumption ( $M \geq B^2$ ) ! If not, use recursive layout, e.g. bit-interleaved layout:

Also known as the Z-Morton layout

Other recursive layouts:

- ▶ U-Morton, X-Morton, G-Morton
- ▶ Hilbert layout

Address computations may become expensive 😞

Possible mix of classic tiles/recursive layout

# Homework 3 – Cache Oblivious Matrix Transposition

## Deadline – September 22

Proposed algorithm to transpose an  $n \times n$  matrix  $A$  into  $B$ :

**MatrixTanspose( $A$ ):**

```
for  $i=1, \dots, n$  do
  for  $j=1, \dots, n$  do
     $B_{i,j} \leftarrow A_{j,i}$ 
return  $B$ 
```

Both matrices  $A$  and  $B$  are stored in row-major layout (each row one after the other).

1. Compute the I/O complexity of this algorithm in the external memory model, with cache size  $M$  and block size  $B$ .
2. Design a cache-oblivious divide-and-conquer algorithm for this problem (when  $n$  is a power of two), and analyse its I/O complexity. Is it asymptotically optimal ?

# Outline

## Cache Oblivious Algorithms and Data Structures

Motivation

Divide and Conquer

**Static Search Trees**

Cache-Oblivious Sorting: Funnels

Dynamic Data-Structures

Distribution sweeping for geometric problem

Conclusion

## Static Search Trees

Problem with B-trees: degree depends on  $B$  ☹️

Binary search tree with recursive layout:

- ▶ Complete binary search tree with  $N$  nodes  
(one node per element)
- ▶ Stored in memory using recursive “van Emde Boas” layout:
  - ▶ Split the tree at the middle height
  - ▶ Top subtree of size  $\sim \sqrt{N} \rightarrow$  recursive layout
  - ▶  $\sim \sqrt{N}$  subtrees of size  $\sim \sqrt{N} \rightarrow$  recursive layout
  - ▶ If height  $h$  is not a power of 2, set subtree height to  $2^{\lceil \log_2 h \rceil} = \lceil h \rceil$
  - ▶ one subtree stored contiguously in memory  
(any order among subtrees)

## Static Search Trees – Analysis

I/O complexity of search operation:

- ▶ For simplicity, assume  $N$  is a power of two
- ▶ For some height  $h$ , a subtree fits in one block ( $B \approx 2^h$ )
- ▶ Reading such a subtree requires at most 2 blocks
- ▶ Root-to-leaf path of length  $\log_2 N$
- ▶ I/O complexity:  $O(\log_2 N / \log_2 B) = O(\log_B N)$
- ▶ Meets the lower bound 😊
- ▶ Only **static** data-structure 😞

# Outline

## Cache Oblivious Algorithms and Data Structures

Motivation

Divide and Conquer

Static Search Trees

**Cache-Oblivious Sorting: Funnels**

Dynamic Data-Structures

Distribution sweeping for geometric problem

Conclusion

## Cache-Oblivious Sorting: Funnels

- ▶ Binary Merge Sort: cache-oblivious 😊, not I/O optimal 😞
- ▶ K-way MergeSort: depends on  $M$  and  $B$  😞, I/O optimal 😊

New data-structure:  $K$ -funnel

- ▶ Complete binary tree with  $K$  leaves
- ▶ Stored using van Emde Boas layout
- ▶ Buffer of size  $K^{3/2}$  between each subtree and the topmost part  
(total:  $K^2$  in these buffers)
- ▶ Each recursive subtree is a  $\sqrt{K}$ -funnel

Total storage in a  $K$  funnel:  $\Theta(K^2)$   
(storage  $S(K) = K^2 + (1 + \sqrt{K})S(\sqrt{K})$ )

# Cache-Oblivious Sorting: Funnels

- ▶ Binary Merge Sort: cache-oblivious 😊, not I/O optimal ☹️
- ▶ K-way MergeSort: depends on  $M$  and  $B$  ☹️, I/O optimal 😊

New data-structure: **K-funnel**

- ▶ Complete binary tree with  $K$  leaves
- ▶ Stored using **van Emde Boas layout**
- ▶ **Buffer of size  $K^{3/2}$**  between each subtree and the topmost part  
(total:  $K^2$  in these buffers)
- ▶ Each recursive subtree is a  $\sqrt{K}$ -funnel

Total storage in a  $K$  funnel:  $\Theta(K^2)$   
(storage  $S(K) = K^2 + (1 + \sqrt{K})S(\sqrt{K})$ )

## Lazy Funnels

- ▶ Consider resulting tree where edges are buffers
- ▶ Output buffer of a K-funnel has size  $K^3$

Fill algorithm: while output buffer not full

1. If left input buffer empty, call Fill on left child
  2. If right input buffer empty, call Fill on right child
  3. Perform one merge step:  
Move smallest element of left and right buffers to output
- ▶ Buffer exhaustion propagates upward
  - ▶ I/O complexity of filling output buffer of size  $K^3$ :

$$O\left(\frac{K^3}{B} \log_M K^3 + K\right)$$

# Funnel Sort

## Funnel-Sort

1. Split input in  $N^{1/3}$  segments of size  $N^{2/3}$
2. Sort segments recursively
3. Use funnel with  $K = N^{1/3}$  to produce output

I/O complexity:  $O(\text{SORT}(N))$

Nb of comparisons:  $O(N \log N)$

Analysis (big picture):

- ▶ Some  $J$ -funnel fits in cache, together with its input buffers
- ▶ When input buffer empty,  $J$ -funnel may be flushed to memory
- ▶ Bound the number of flushes and I/Os in the funnel

# Outline

## Cache Oblivious Algorithms and Data Structures

Motivation

Divide and Conquer

Static Search Trees

Cache-Oblivious Sorting: Funnels

**Dynamic Data-Structures**

Distribution sweeping for geometric problem

Conclusion

## PMA: Packed Memory Array

Goal: Store  $N$  ordered elements in array of size  $P = cN$

Contradictory objectives:

- ▶ Pack nodes for **fast scan** of  $S$  elements ( $O(1 + S/B)$ )
- ▶ Leave enough room for **fast insertion**

PMA:

- ▶ Array divided into **segments of size  $\log P$**
- ▶ **Virtual complete binary tree** whose leaves are these segments
- ▶ Density of a node:

$$\rho = \frac{\text{number of elements in subtree}}{\text{capacity of the subtree}}$$

- ▶ **Constraints on density:**  $1/2 - 1/4d/h \leq \rho \leq 3/4 + 1/4d/h$   
 $d$ : depth of the node,  $h$ : height of the tree  
→ up in the tree: less slack on density

## Packed Memory Array: Details

Insertion algorithm:

- ▶ Find segment (leaf in the tree)
- ▶ If segment not full, insert (move other elements if needed)
- ▶ If segment full, before inserting the element:
  1. Climb in tree to find ancestor that respects density constraints  
Parallel left and right scan counting elements
  2. Rebalance subtree: redistribute all elements uniformly in existing leaves  
Some additional scans
  3. For big changes in  $N$ : rebuild everything

(Same for deletions)

Amortized cost of insertion:  $O(1 + \log^2 N/B)$

## Packed Memory Array: Details

Insertion algorithm:

- ▶ Find segment (leaf in the tree)
- ▶ If segment not full, insert (move other elements if needed)
- ▶ If segment full, before inserting the element:
  1. Climb in tree to find ancestor that respects density constraints  
Parallel left and right scan counting elements
  2. Rebalance subtree: redistribute all elements uniformly in existing leafs  
Some additional scans
  3. For big changes in  $N$ : rebuild everything

(Same for deletions)

Amortized cost of insertion:  $O(1 + \log^2 N/B)$

## Cache-Oblivious B-Trees

- ▶ PMA to store elements
- ▶ Static Search Tree with  $\Theta(N)$  leaves  
a node store the maximum of its two children
- ▶ Bi-directional pointers between tree leaves and PMA cells
- ▶ Search: using search tree
- ▶ Insertion: in the PMA, then propagate changes in the tree

### Theorem (Cache-oblivious B-Trees).

This data-structure has the following I/O cost:

- ▶ Insertion and deletions in  $O(\log_B N + (\log^2 N)/B)$  (amortized)
- ▶ Search in  $O(\log_B N)$
- ▶ Scanning  $K$  consecutive elements in  $O(\lceil K/B \rceil)$

NB: Removing the  $(\log^2 N)/B$  term leads to loosing fast scanning

# Outline

## Cache Oblivious Algorithms and Data Structures

Motivation

Divide and Conquer

Static Search Trees

Cache-Oblivious Sorting: Funnels

Dynamic Data-Structures

Distribution sweeping for geometric problem

Conclusion

## Distribution sweeping for geometric problem

Distribution sweeping:

- ▶ Sort geometric objects (e.g. w.r.t. one dimension)
- ▶ Split problem into strips
- ▶ Divide-and-conquer approach on strips
- ▶ Merge results via a sweep of strips in another dimension (cache-oblivious merge: 2-way)

### Multidimensional Maxima Problem

Given a set of points in  $d$  dimensions, a point  $p = (p_1, p_2, \dots, p_d)$  **dominates** another point  $q$  if  $p_i \geq q_i$  for all  $i$ . Given  $N$  points, report the **maximal points** (points non dominated).

- ▶ 1D: Single maximum
- ▶ 2D: Simple sweep algorithm:
  1. Sort point by decreasing first coordinate
  2. Report point if its second coordinate is larger than the one of the last reported point

What about the 3D problem ?

## Distribution sweeping for geometric problem

Distribution sweeping:

- ▶ Sort geometric objects (e.g. w.r.t. one dimension)
- ▶ Split problem into strips
- ▶ Divide-and-conquer approach on strips
- ▶ Merge results via a sweep of strips in another dimension (cache-oblivious merge: 2-way)

## Divide-and-Conquer for 3D Maxima

- ▶ Sort points according to  $z$
- ▶ Divide points in strips
- ▶ For each strip: report (output) maximal points sorted by decreasing  $x$

Base case: strip with a single point (reported)

When merging strips  $A$  and  $B$  (with  $z_B > z_A$ ):

- ▶ all points in  $B$  have larger  $z$ : all maximal points kept
- ▶ maximal points in  $A$  are maximal in  $A \cup B$  iff there are not dominated by some maximal point of  $B$

Merging Algorithm:

- ▶ Scan maximal points of  $A$  and  $B$  by decreasing  $x$
- ▶ Keep track of the largest  $y_B$  of nodes from  $B$
- ▶ If next node comes from  $B$ : keep it (output), update  $y_B$
- ▶ If next node comes from  $A$  and has larger  $y$  than current  $y_B$ : keep it (output), otherwise, delete it

## Divide-and-Conquer for 3D Maxima

# Divide-and-Conquer for 3D Maxima

Summary of algorithm:

1. Sort by decreasing  $z$
2. Recursively process strips
3. Merge sorted sequences by comparing to  $y_B$ , remove some nodes

# Divide-and-Conquer for 3D Maxima

Summary of algorithm:

1. Sort by decreasing  $z$
2. Recursively process strips
3. Merge sorted sequences by comparing to  $y_B$ , remove some nodes

Cache-oblivious version: ?

# Divide-and-Conquer for 3D Maxima

Summary of algorithm:

1. Sort by decreasing  $z$
2. Recursively process strips
3. Merge sorted sequences by comparing to  $y_B$ , remove some nodes

Cache-oblivious version:

- ▶ Step 1: (Lazy) Funnel-Sort
- ▶ Step 3: (Lazy) Funnel-Sort with modified merger to remember  $y_B$   
( $O(1)$  extra space on each node)

Complexity:  $O(SORT(N))$

# Outline

## Cache Oblivious Algorithms and Data Structures

Motivation

Divide and Conquer

Static Search Trees

Cache-Oblivious Sorting: Funnels

Dynamic Data-Structures

Distribution sweeping for geometric problem

Conclusion

## Conclusion

- ▶ Clean model, algorithms independent from architectural parameters  $M$  and  $B$
- ▶ Good news: match external memory bounds in most cases
  
- ▶ Best tool: divide-and-conquer
- ▶ Base case of the analysis differs from algorithm base case:
  - ▶ Sometimes  $N = \Theta(M)$  (mergesort, matrix mult., ...)
  - ▶ Sometimes  $N = \Theta(B)$  (static search tree, ...)
  
- ▶ New algorithmic solutions to force data locality
- ▶ Can lead to real performance gains for large  $N$
