

Linear Differential Equations as a Data-Structure

Bruno Salvy

Inria & ENS de Lyon

FoCM, July 14, 2017

Computer Algebra

Effective mathematics: what can we **compute exactly**?
And complexity: how fast? (also, how big is the result?)

Systems with several million users

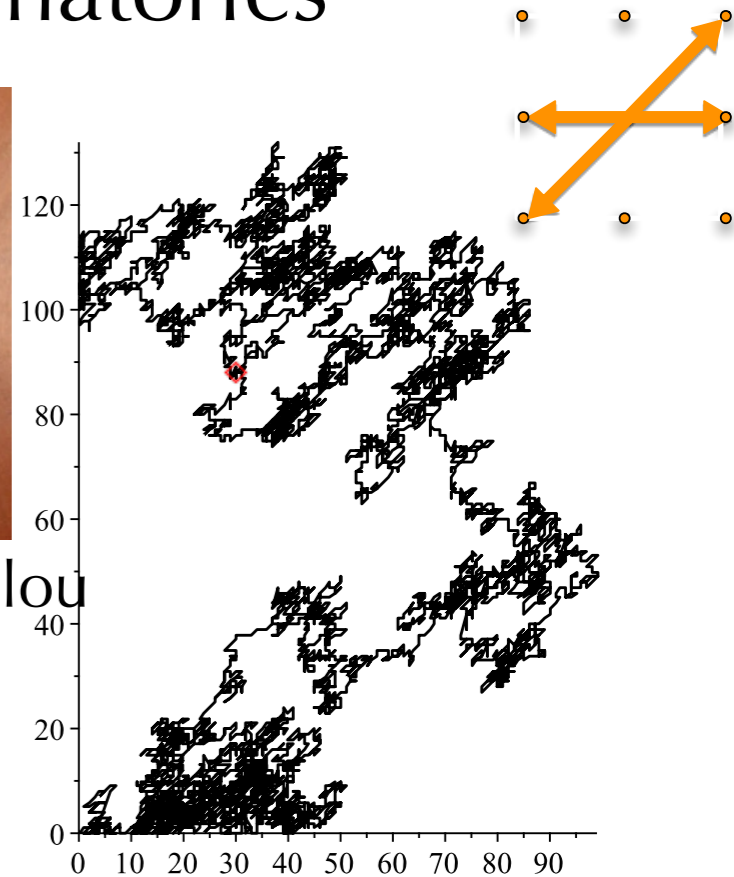

50+ years of algorithmic progress
in computational mathematics!

Sources of Linear Differential Equations

Generating functions
in combinatorics

M. Bousquet-Mélou

Classical elementary
and special functions
(small order)

Periods

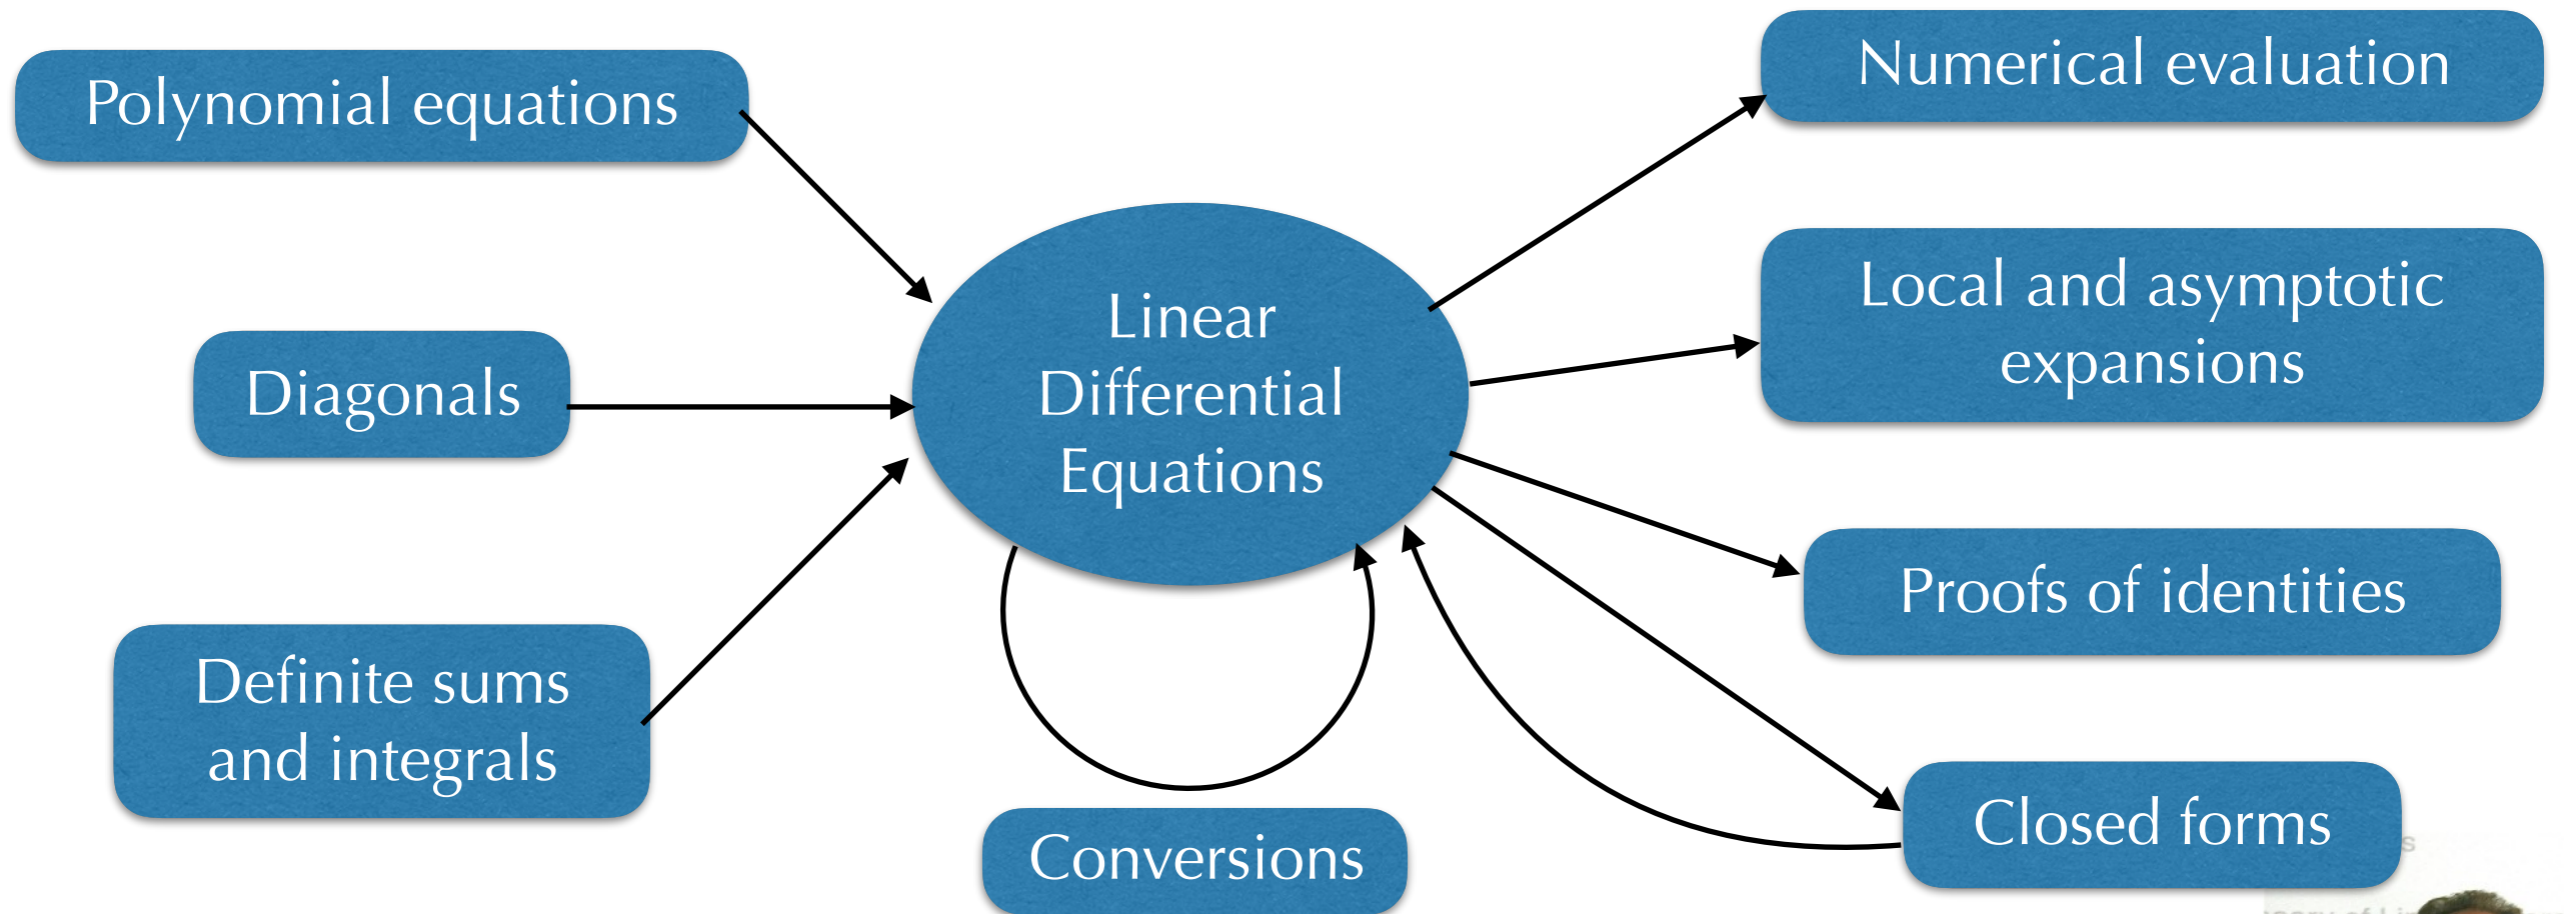

P. Lairez

A. Bostan

LDEs as a Data-Structure

M. Singer

Solutions called **differentially finite** (abbrev. D-finite)

A. Using Linear Differential Equations Exactly

**A. Using Linear Differential
Equations Exactly**
I. Numerical Values

Fast Computation with Linear Recurrences (70's and 80's)

1. Multiplication of integers is fast (Fast Fourier Transform):
millions of digits \ll 1sec.

2. $n!$ in complexity $\tilde{O}(n)$ by divide-and-conquer

$$n! := \underbrace{n \times \cdots \times \lceil n/2 \rceil}_{\text{size } O(n \log n)} \times \underbrace{(\lceil n/2 \rceil - 1) \times \cdots \times 1}_{\text{size } O(n \log n)}$$

Notation:
 $\tilde{O}(n)$ means
 $O(n \log^k n)$ for
some k

3. Linear recurrence: convert into 1st order recurrence
on vectors and apply the same idea.

Ex: $e_n := \sum_{k=0}^n \frac{1}{k!}$ satisfies a 2nd order rec, computed via

$$\begin{pmatrix} e_n \\ e_{n-1} \end{pmatrix} = \frac{1}{n} \underbrace{\begin{pmatrix} n+1 & -1 \\ n & 0 \end{pmatrix}}_{A(n)} \begin{pmatrix} e_{n-1} \\ e_{n-2} \end{pmatrix} = \frac{1}{n!} A!(n) \begin{pmatrix} 1 \\ 0 \end{pmatrix}.$$

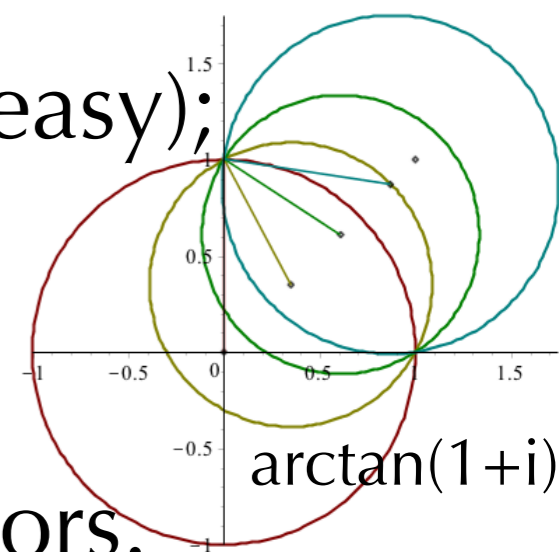

Conclusion: Nth element in $\tilde{O}(N)$ ops.

Numerical evaluation of solutions of LDEs

Principle: $f(x) = \underbrace{\sum_{n=0}^N a_n x^n}_{\text{fast evaluation}} + \underbrace{\sum_{n=N+1}^{\infty} a_n x^n}_{\text{good bounds}}$

f solution of a LDE with coeffs in $\mathbb{Q}(x)$

1. linear recurrence in N for the first sum (easy);
2. tight bounds on the tail (technical);
3. extend to \mathbb{C} by analytic continuation.

Computation on integers. No roundoff errors.

Conclusion: value anywhere with N digits in $\tilde{O}(N)$ ops.

Dynamic Dictionary of Mathematical Functions

Home

Dynamic Dictionary of Mathematical Functions

Welcome to this interactive site on [Mathematical Functions](#), with properties, truncated expansions, numerical evaluations, plots, and more. The functions currently presented are elementary functions and special functions of a single variable. More functions — special functions with parameters, orthogonal polynomials, sequences — will be added with the project advances.

This is release 1.9.1 of DDMF
Select a special function from the list

What's new? The main changes in this release 1.9.1, dated May 2013, are:

- Proofs related to Taylor polynomial approximations.

Release [history](#).

More on the project:

A. Using Linear Differential Equations Exactly

III. Proofs of Identities

Proof technique

> series($\sin(x)^2 + \cos(x)^2 - 1, x, 4$);

f satisfies a LDE

f, f', f'', ... live in a
finite-dim. vector space

$O(x^4)$

Why is this a proof?

1. sin and cos satisfy a 2nd order LDE: $y'' + y = 0$;
2. their squares and their sum satisfy a 3rd order LDE;
3. the constant -1 satisfies $y' = 0$;
4. thus $\sin^2 + \cos^2 - 1$ satisfies a LDE of order at most 4;
5. the Cauchy-Lipschitz theorem concludes.

Proofs of non-linear identities by linear algebra!

Mehler's identity for Hermite polynomials

$$\sum_{n=0}^{\infty} H_n(x)H_n(y) \frac{u^n}{n!} = \frac{\exp\left(\frac{4u(xy - u(x^2 + y^2))}{1 - 4u^2}\right)}{\sqrt{1 - 4u^2}}$$

1. Definition of Hermite polynomials:
recurrence of order **2**;
2. Product by linear algebra: $H_{n+k}(x)H_{n+k}(y)/(n+k)!$, $k \in \mathbb{N}$
generated over $\mathbb{Q}(x, n)$ by
$$\frac{H_n(x)H_n(y)}{n!}, \frac{H_{n+1}(x)H_n(y)}{n!}, \frac{H_n(x)H_{n+1}(y)}{n!}, \frac{H_{n+1}(x)H_{n+1}(y)}{n!}$$

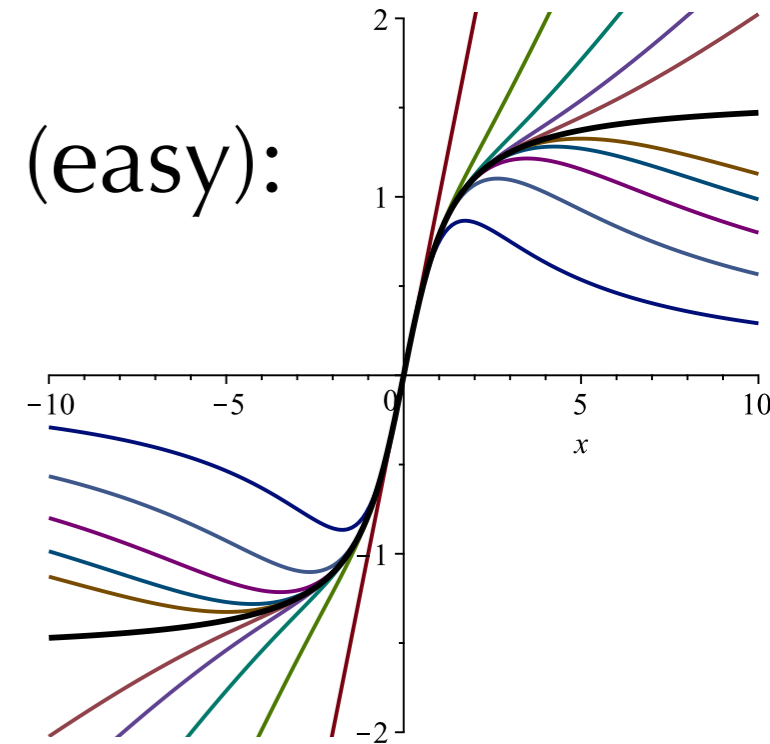

→ recurrence of order **at most 4**;
3. Translate into differential equation.

Guess & Prove Continued Fractions

1. Taylor expansion produces first terms (easy):

$$\arctan x = \frac{x}{1 + \frac{\frac{1}{3}x^2}{1 + \frac{\frac{4}{15}x^2}{1 + \frac{\frac{9}{35}x^2}{1 + \dots}}}}$$

2. **Guess** a formula (easy): $a_n = \frac{n^2}{4n^2 - 1}$

3. **Prove** that the CF with these a_n converges to \arctan :

show that $H_n := Q_n^2 \left((x^2 + 1)(P_n/Q_n)' - 1 \right) = O(x^n)$

where P_n/Q_n is the n th convergent.

`gfun [ContFrac]`

Algo \approx **compute a LRE** for H_n and simplify it.

No human intervention needed.

It Works!

- This method has been applied to all explicit C-fractions in Cuyt *et alii*, starting from either:
a Riccati equation:

$$y' = A(z) + B(z)y + C(z)y^2$$

a q -Riccati equation:

$$y(qz) = A(z) + B(z)y(z) + C(z)y(z)y(qz)$$

a difference Riccati equation:

$$y(s + 1) = A(s) + B(s)y(s) + C(s)y(s)y(s + 1)$$

- **It works in all cases**, including Gauss's CF, Heine's q -analogue and Brouncker's CF for Gamma.
- In all cases, H_n satisfies a recurrence of **small order**.

*In progress: 1. explain why this method works so well,
2. classify the formulas it yields.*

B. Conversions (LDE → LDE)

From equations to operators

$$D_x \leftrightarrow d/dx$$

$$x \leftrightarrow \text{mult by } x$$

$$\text{product} \leftrightarrow \text{composition}$$

$$D_x x = x D_x + 1$$

$$S_n \leftrightarrow (n \mapsto n+1)$$

$$n \leftrightarrow \text{mult by } n$$

$$\text{product} \leftrightarrow \text{composition}$$

$$S_n n = (n+1) S_n$$

Taylor morphism: $D_x \mapsto (n+1)S_n$; $x \mapsto S_n^{-1}$

produces linear recurrence from LDE

Ex. (erf):

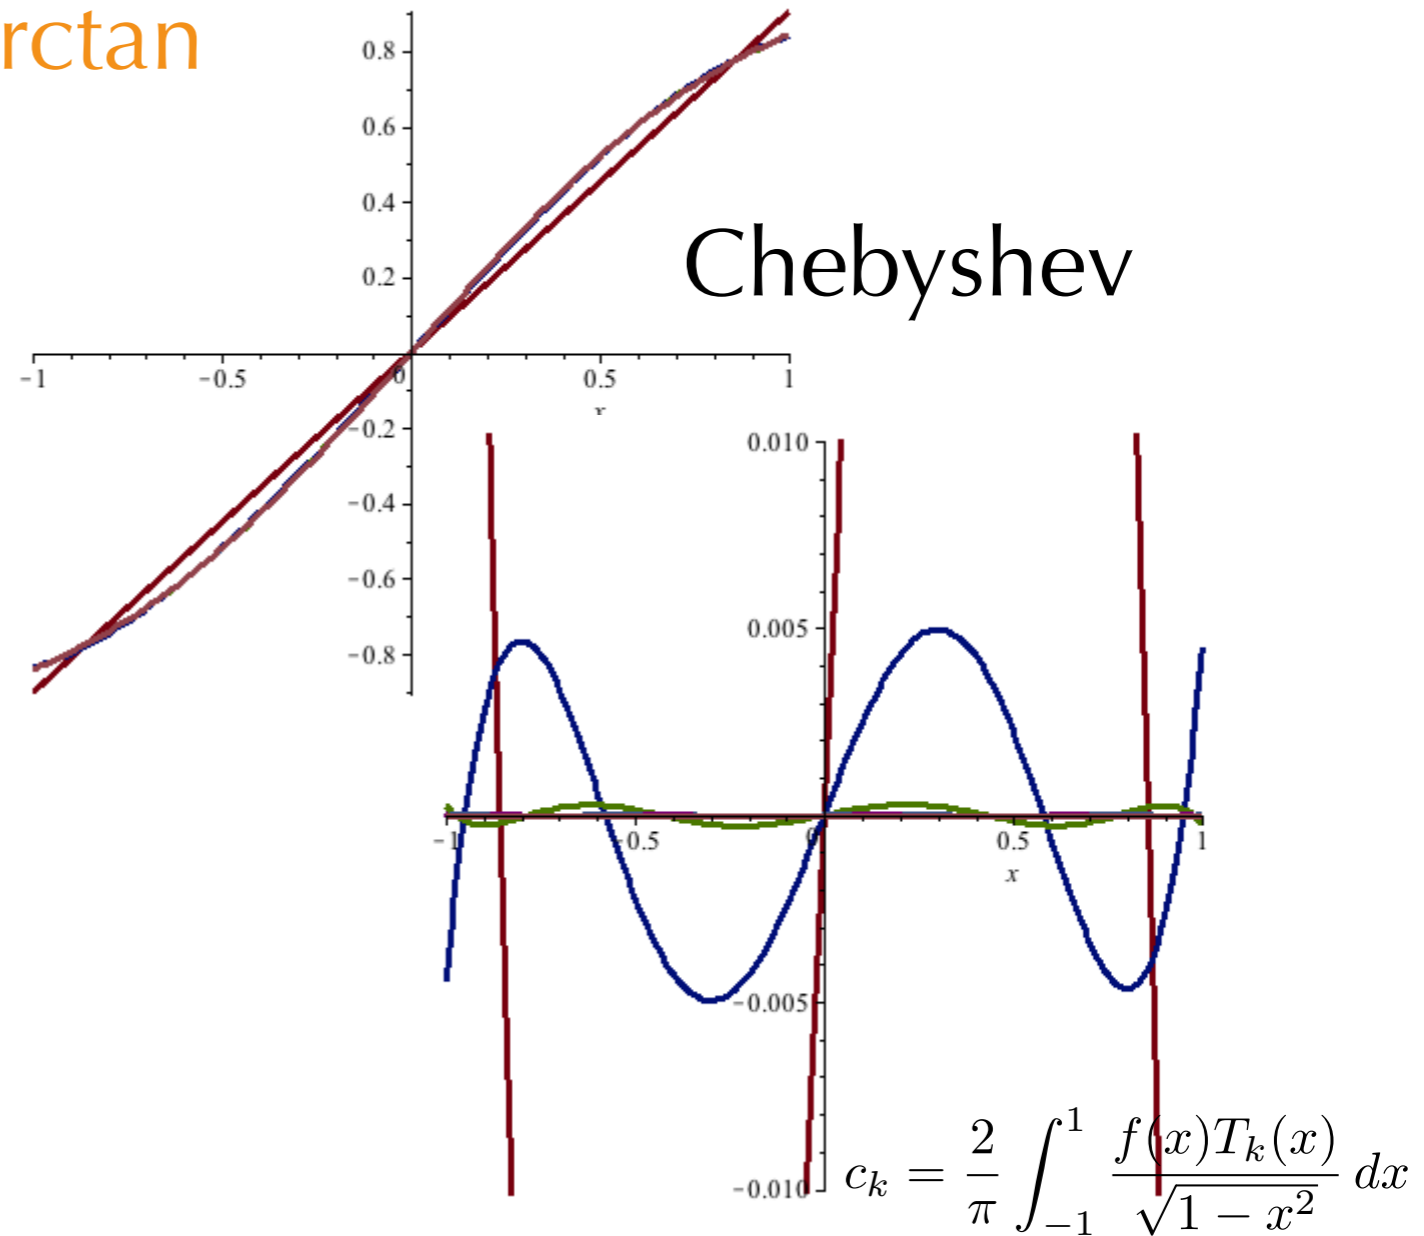

$$D_x^2 + 2x D_x \mapsto (n+1)S_n(n+1)S_n + 2S_n^{-1}(n+1)S_n = (n+1)(n+2)S_n^2 + 2n$$

Chebyshev expansions

$$z - \frac{1}{3}z^3 + \frac{1}{5}z^5 + \dots$$

arctan

$$2(\sqrt{2} + 1) \left(\frac{T_1(x)}{(2\sqrt{2} + 3)} - \frac{T_3(x)}{3(2\sqrt{2} + 3)^2} + \frac{T_5(x)}{5(2\sqrt{2} + 3)^3} + \dots \right)$$

$$c_k = \frac{2}{\pi} \int_{-1}^1 \frac{f(x)T_k(x)}{\sqrt{1-x^2}} dx$$

Ore fractions

Generalize commutative case:

$$R=Q^{-1}P \text{ with } P \text{ \& } Q \text{ operators.}$$

$$B^{-1}A=D^{-1}C \text{ when } bA=dC \text{ with } bB=dD=LCLM(B,D).$$

Algorithms for sum and product:

$$B^{-1}A+D^{-1}C=LCLM(B,D)^{-1}(bA+dC), \text{ with } bB=dD=LCLM(B,D)$$

$$B^{-1}AD^{-1}C=(aB)^{-1}dC, \text{ with } aA=dD=LCLM(A,D).$$

Application: Chebyshev expansions

Taylor

$$x^{n+1} = x \cdot x^n \leftrightarrow x \mapsto X := S^{-1}$$

$$(x^n)' = nx^{n-1} \leftrightarrow d/dx \mapsto D := (n+1)S$$

Chebyshev

$$2xT_n(x) = T_{n+1}(x) + T_{n-1}(x)$$

$$\leftrightarrow x \mapsto X := (S_n + S_n^{-1})/2$$

$$2(1-x^2)T_n'(x) = -nT_{n+1}(x) + nT_{n-1}(x)$$

$$\leftrightarrow d/dx \mapsto D := (1-X^2)^{-1}n(S_n - S_n^{-1})/2.$$

Prop. If y is a solution of $L(x, d/dx)$, then its Chebyshev coefficients annihilate the **numerator** of $L(X, D)$.

> `deqarctan := (x^2+1)*diff(y(x), x)-1:`

> `diffEqToGFSSRec(deqarctan, y(x), u(n), functions=ChebyshevT(n, x));`

$$nu(n) + 6(n+2)u(n+2) + (n+4)u(n+4)$$

Applications to Validated Numerical Approximation

C. Computing Linear Differential Equations (Efficiently)

C. Computing Linear Differential Equations (Efficiently)

I. Algebraic Series and Questions of Size

Algebraic Series can be Computed Fast

$$P(X, Y(X)) = 0 \quad P \text{ irreducible}$$

Wanted: the first N Taylor coefficients of Y .

$$P_x(X, Y(X)) + P_y(X, Y(X)) \cdot Y'(X) = 0$$

$$Y'(X) = (-P_x P_y^{-1} \bmod P)(X, Y(X))$$

a polynomial

Note:
 F sol LDE
 $\Rightarrow F(Y(X))$ sol LDE
(same argument)

$$Y(X), Y'(X), Y''(X), \dots \text{ in } \text{Vect}_{\mathbb{Q}(X)}(1, Y, Y^2, \dots)$$

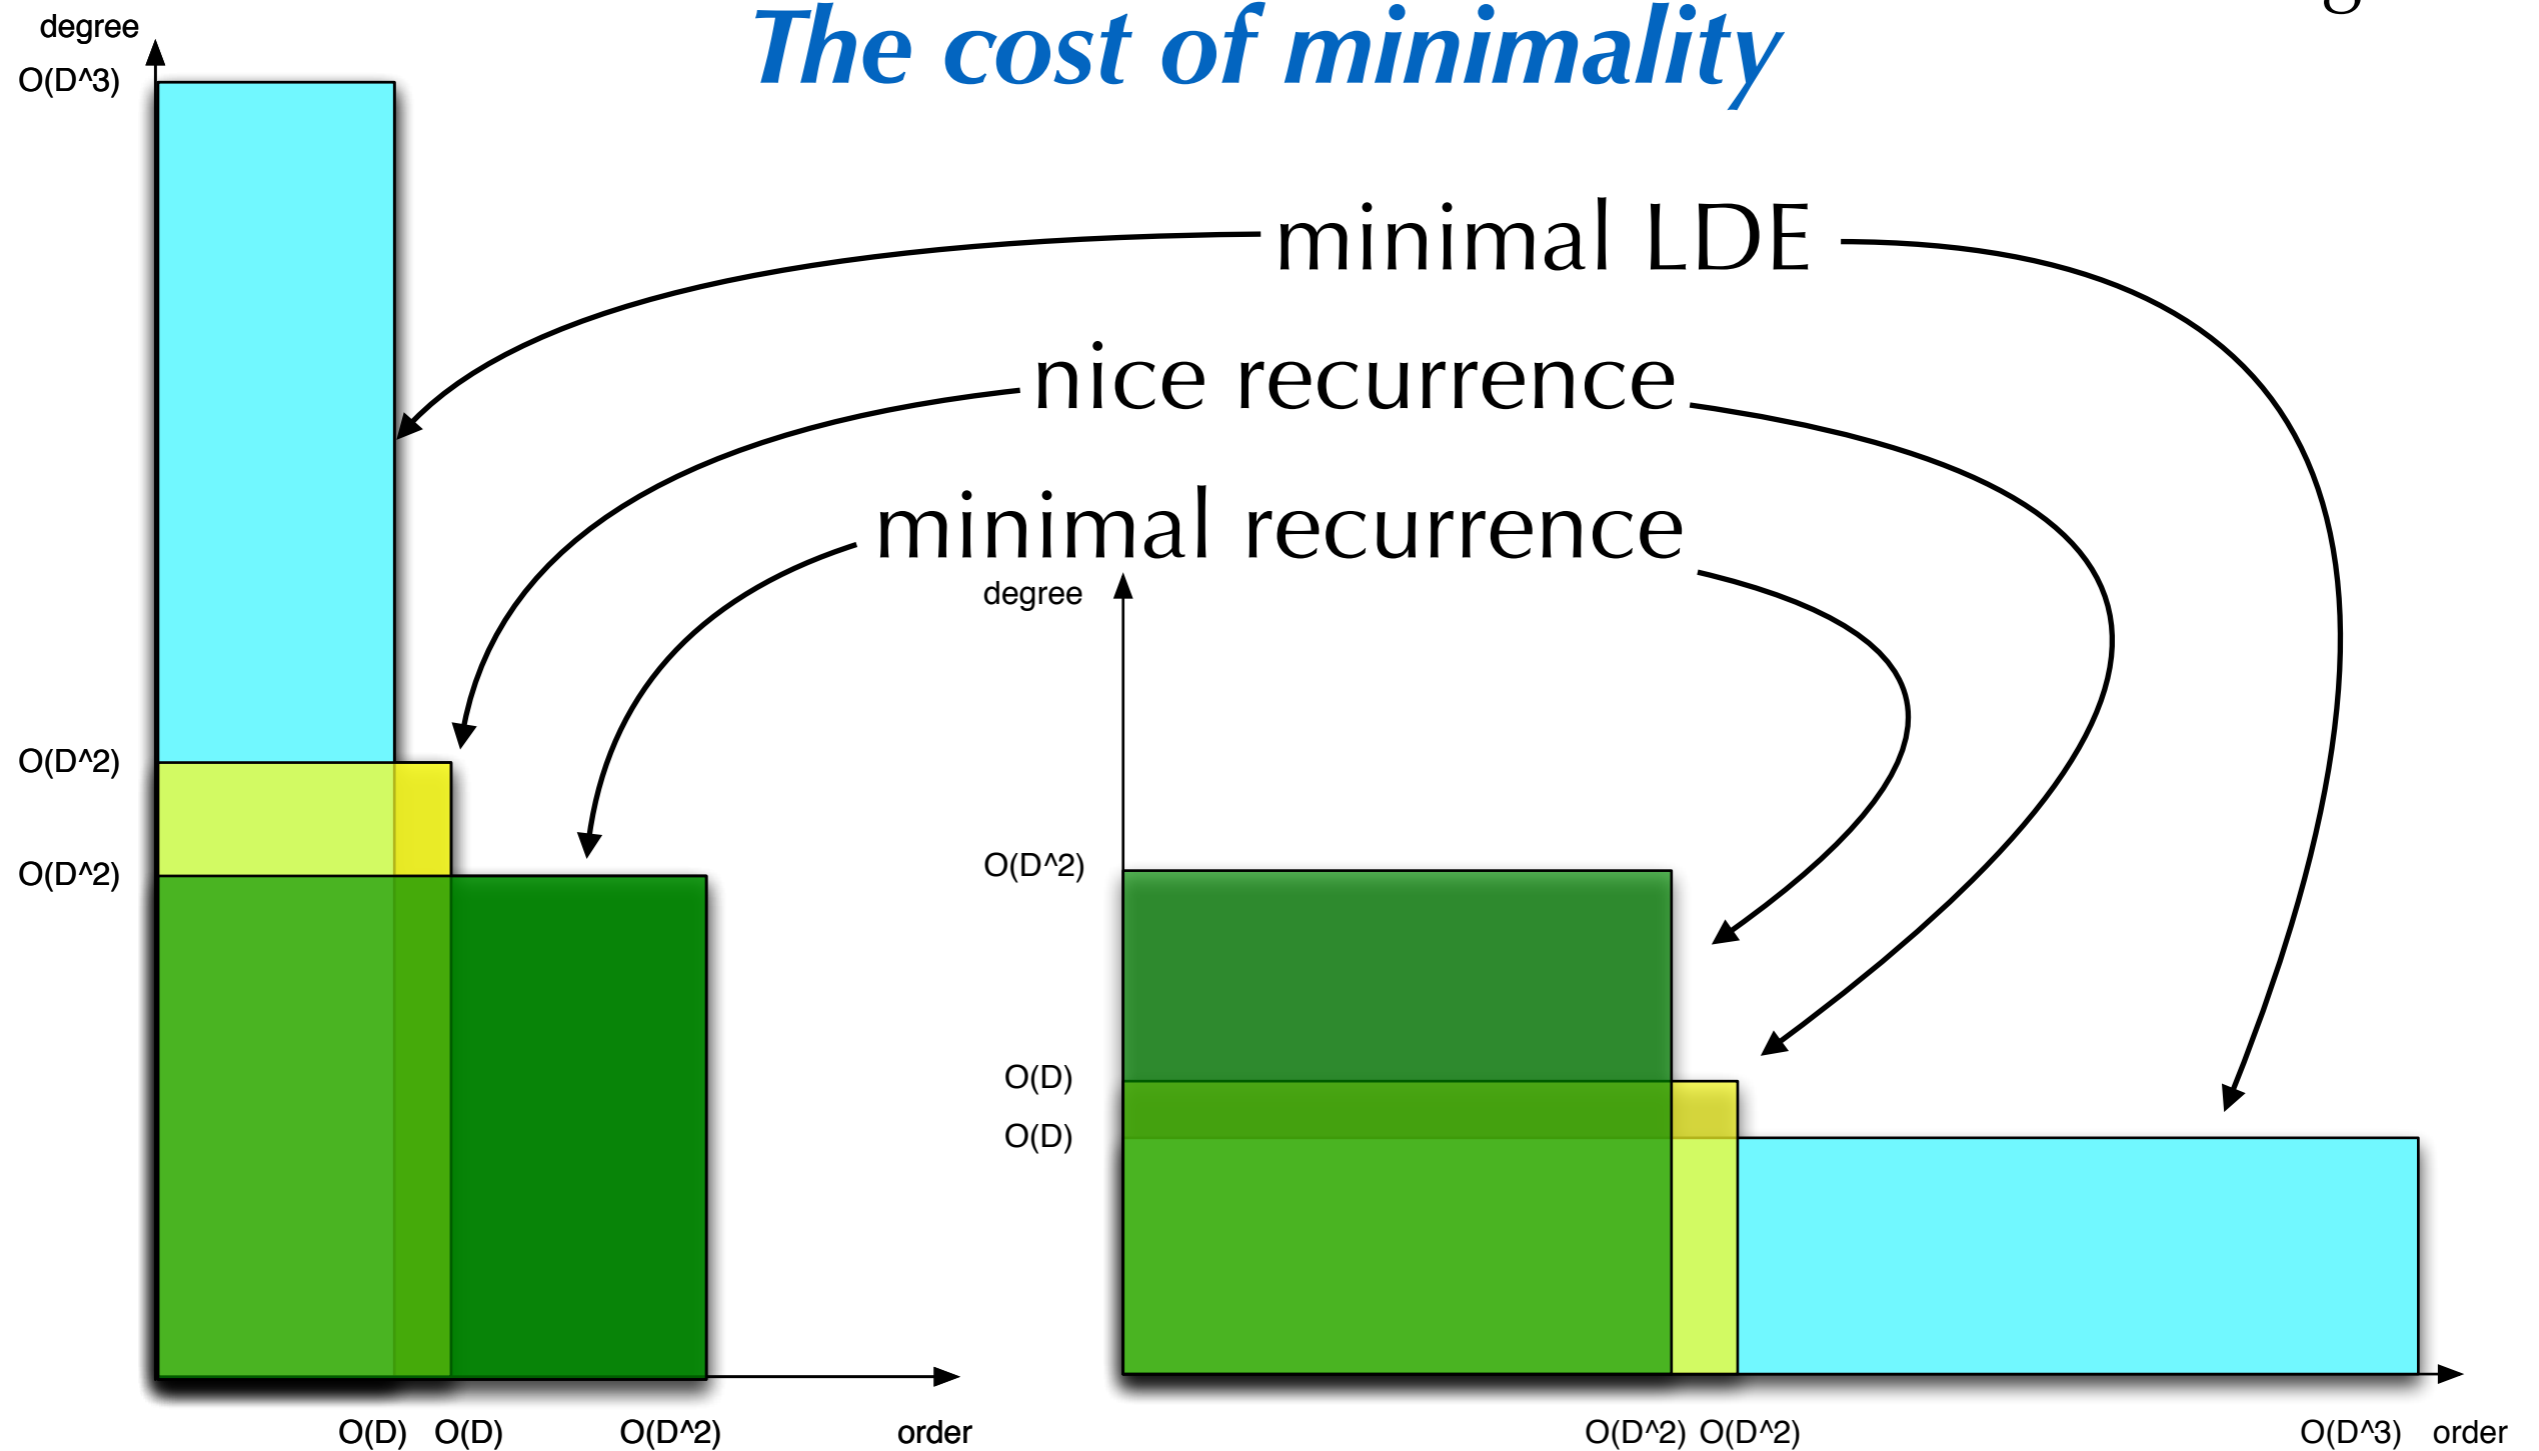

finite dimension (deg P)

\rightarrow a LDE by linear algebra

Order-Degree Curve

The cost of minimality

$D = \deg P$

differential equations

corresponding recurrences

C. Computing Linear Differential Equations (Efficiently)

II. Creative Telescoping

Examples

$$\sum_{k=0}^n \binom{n}{k}^2 \binom{n+k}{k}^2 = \sum_{k=0}^n \binom{n}{k} \binom{n+k}{k} \sum_{j=0}^k \binom{k}{j}^3$$

$$\sum_{j,k} (-1)^{j+k} \binom{j+k}{k+l} \binom{r}{j} \binom{n}{k} \binom{s+n-j-k}{m-j} = (-1)^l \binom{n+r}{n+l} \binom{s-r}{m-n-l}$$

$$\int_0^{+\infty} x J_1(ax) I_1(ax) Y_0(x) K_0(x) dx = -\frac{\ln(1-a^4)}{2\pi a^2}$$

$$\frac{1}{2\pi i} \oint \frac{(1+2xy+4y^2) \exp\left(\frac{4x^2y^2}{1+4y^2}\right)}{y^{n+1}(1+4y^2)^{\frac{3}{2}}} dy = \frac{H_n(x)}{[n/2]!}$$

$$\sum_{k=0}^n \frac{q^{k^2}}{(q; q)_k (q; q)_{n-k}} = \sum_{k=-n}^n \frac{(-1)^k q^{(5k^2-k)/2}}{(q; q)_{n-k} (q; q)_{n+k}}$$

- Aims:**
1. Prove them automatically
 2. Find the rhs given the lhs

Note: at least one free variable

First: find a LDE (or LRE)

Creative telescoping

$$I(x) = \int f(x, t) dt =? \quad \text{or} \quad U(n) = \sum_k u(n, k) =?$$

Input: equations (differential for f or recurrence for u).

Output: equations for the sum or the integral.

Ex.: $U_n := \sum_k \binom{n}{k}$

$$U_{n+1} - 2U_n = \sum_k \binom{n+1}{k} - 2 \binom{n}{k} = \sum_k \underbrace{\binom{n+1}{k} - \binom{n+1}{k+1}}_{\text{telescopes}} + \underbrace{\binom{n}{k+1} - \binom{n}{k}}_{\text{telescopes}}$$

Aim: find $A(n, S_n)$ and $B(n, k, S_n, S_k)$ such that

Def: $\Delta_k := S_k - 1$.

$$(A(n, S_n) + \Delta_k B(n, k, S_n, S_k)) \cdot u(n, k) = 0,$$

certificate

then the sum telescopes, leading to $A(n, S_n) \cdot U(n) = 0$.

Integrals: differentiate under the \int sign and integrate by parts.

Telescoping Ideal

$$T_t(f) := \left(\text{Ann } f + \underbrace{\partial_t \mathbb{Q}(\mathbf{x}, t) \langle \partial_{\mathbf{x}}, \partial_t \rangle}_{\substack{\text{int. by parts} \\ \text{(certificate)}}} \right) \cap \underbrace{\mathbb{Q}(\mathbf{x}) \langle \partial_{\mathbf{x}} \rangle}_{\text{diff. under } \int}.$$

First generation of algorithms relying on holonomy

Restrict int. by parts to $\mathbb{Q}(\mathbf{x}) \langle \partial_{\mathbf{x}}, \partial_t \rangle$ and use elimination.

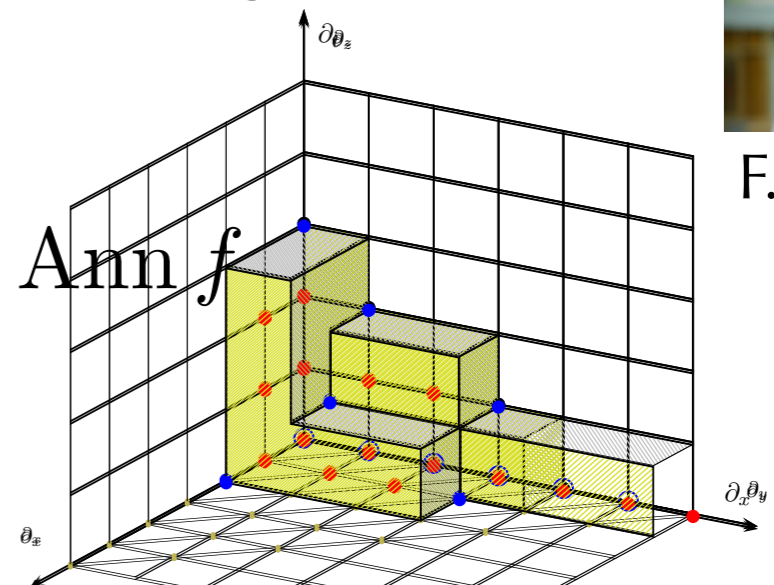

Second generation: faster using better certificates & algorithms

Hypergeometric summation: dim=1 + param. Gosper.

Undetermined coefficients in finite dim, Ore algebras & GB.

Idem in infinite dim.

$$\sum_k c_k(\mathbf{x}) \partial_{\mathbf{x}}^k - \partial_t \sum_{i,j \in S} a_{i,j}(\mathbf{x}, t) \partial_{\mathbf{x}}^i \partial_t^j \in \text{Ann } f$$

F. Chyzak

C. Computing Linear Differential Equations (Efficiently)

III. 3rd Generation Creative Telescoping

Certificates are big

$$C_n := \sum_{r,s} \underbrace{(-1)^{n+r+s} \binom{n}{r} \binom{n}{s} \binom{n+s}{s} \binom{n+r}{r} \binom{2n-r-s}{n}}_{f_{n,r,s}}$$

$$(n+2)^3 C_{n+2} - 2(2n+3)(3n^2+9n+7)C_{n+1} - (4n+3)(4n+4)(4n+5)C_n = 180 \text{ kB} \simeq 2 \text{ pages}$$

$$I(z) = \oint \frac{(1+t_3)^2 dt_1 dt_2 dt_3}{t_1 t_2 t_3 (1+t_3(1+t_1))(1+t_3(1+t_2)) + z(1+t_1)(1+t_2)(1+t_3)^4}$$

$$z^2(4z+1)(16z-1)I'''(z) + 3z(128z^2+18z-1)I''(z) + (444z^2+40z-1)I'(z) + 2(30z+1)I(z) = 1080 \text{ kB}$$

$\simeq 12 \text{ pages}$

3rd-generation algorithms: avoid computing the certificate

Periods

$$I(t) = \oint \frac{P(t, \underline{x})}{\underbrace{Q^m(t, \underline{x})}_{\in \mathbb{Q}(t, \underline{x})}} d\underline{x}$$

Q square-free
Int. over a cycle
where $Q \neq 0$.

$$\underline{x} = (x_1, \dots, x_n)$$

$$N := \deg_{\underline{x}} Q, \quad d_t := \max(\deg_t Q, \deg_t P)$$

$\deg_x P$ not too big

Thm. A linear differential equation for $I(t)$ can be computed in $O(e^{3n} N^{8n} d_t)$ operations in \mathbb{Q} .

It has order $\leq N^n$ and degree $O(e^n N^{3n} d_t)$.

tight

Note: generically, the certificate has at least $N^{n^2/2}$ monomials.

*Applications to diagonals
& to multiple binomial sums.*

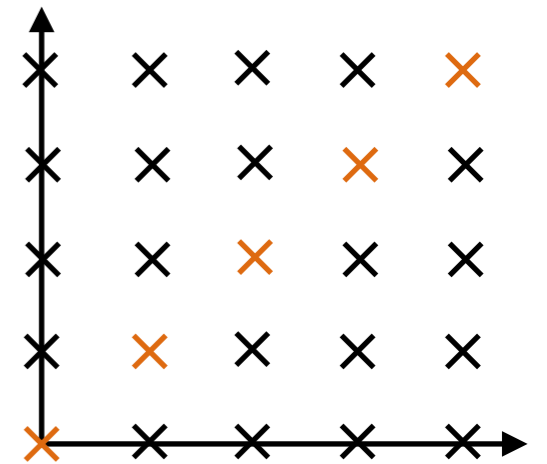

Diagonals

in this talk

If $F(\mathbf{z}) = \frac{G(\mathbf{z})}{H(\mathbf{z})}$ is a multivariate **rational** function with Taylor expansion

$$F(\mathbf{z}) = \sum_{\mathbf{i} \in \mathbb{N}^n} c_{\mathbf{i}} \mathbf{z}^{\mathbf{i}},$$

its **diagonal** is $\Delta F(t) = \sum_{k \in \mathbb{N}} c_{k,k,\dots,k} t^k.$

$$\binom{2k}{k} : \frac{1}{1-x-y} = \textcircled{1} + x + y + \textcircled{2}xy + x^2 + y^2 + \dots + \textcircled{6}x^2y^2 + \dots$$

$$\frac{1}{k+1} \binom{2k}{k} : \frac{1-2x}{(1-x-y)(1-x)} = \textcircled{1} + y + \textcircled{1}xy - x^2 + y^2 + \dots + \textcircled{2}x^2y^2 + \dots$$

$$\text{Apéry's } a_k : \frac{1}{1-t(1+x)(1+y)(1+z)(1+y+z+yz+xyz)} = \textcircled{1} + \dots + \textcircled{5}xyzt + \dots$$

Christol's conjecture: All differentially finite power series with integer coefficients and radius of convergence in $(0, \infty)$ are diagonals.

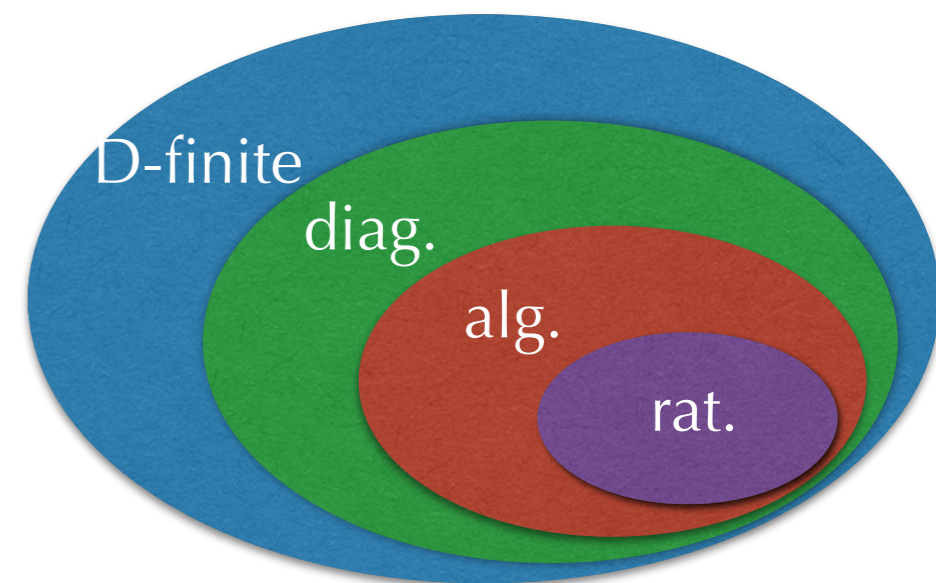

Diagonals are Differentially Finite

[Christol84, Lipshitz88]

$$\Delta F(z_1, \dots, z_d) = \left(\frac{1}{2\pi i} \right)^{d-1} \oint F \left(\frac{t}{z_2 \cdots z_d}, z_2, \dots, z_d \right) \frac{dz_2}{z_2} \cdots \frac{dz_d}{z_d}$$

Thm. If F has degree d in n variables, ΔF satisfies a LDE with order $\approx d^n$, coeffs of degree $d^{O(n)}$.

+ algo in $\tilde{O}(d^{8n})$ ops.

Univariate power series

Multiple Binomial Sums

Ex.
$$S_n = \sum_{r \geq 0} \sum_{s \geq 0} (-1)^{n+r+s} \binom{n}{r} \binom{n}{s} \binom{n+s}{s} \binom{n+r}{r} \binom{2n-r-s}{n}$$

Thm. Diagonals \equiv binomial sums with 1 free index.

defined properly

> BinomSums[sumtores](S,u): (...)

$$\frac{1}{1 - t(1 + u_1)(1 + u_2)(1 - u_1u_3)(1 - u_2u_3)}$$

has for diagonal the generating function of S_n
