\pi\text{-calculus, internal mobility and behavioural properties}

M2 internship, Daniel Hirschkoff, Plume team, ENS de Lyon

Context

The \pi\text{-calculus is a core calculus for concurrent and mobile computation based on the notion of channels. Various techniques have been studied to reason about \pi\text{-calculus processes, notably behavioural equivalences, type systems and modal logics.}

The \pi\text{-calculus is very expressive: it is possible in particular to encode rich programming languages, including higher-order, concurrent or imperative features in the \pi\text{-calculus.}

Several variants of the \pi\text{-calculus have been introduced in order to analyse this expressive power, and to provide useful techniques to reason about encodings of programming language features.

The internship

The internship will focus on \textit{I}\pi, the \pi\text{-calculus with internal mobility} \cite{durier2022eager, hirschkoff2022eager}, which is one such variant. \textit{I}\pi has been notably used to analyse encodings of the call-by-value \lambda\text{-calculus in the \pi\text{-calculus, and extensions thereof} \cite{durier2021eager, hirschkoff2021eager}. These works, together with recent developments, suggest exploring further this rather well-established subcalculus of \pi, exploring in particular certain extensions of \textit{I}\pi.

The student is expected to get familiar with relevant works in the field (see the bibliography below), and to define and analyse behavioural equivalences for an extended \textit{I}\pi-calculus. Such equivalences will be based on the bisimulation proof technique, which makes it possible to define powerful proof techniques \cite{bisimulation}. In some cases, the bisimulation approach can be enhanced using types, which we shall also consider in the internship. One expected outcome of this work is a better understanding of the central rôle played by \textit{I}\pi in the study of contextual equivalence for higher-order programming languages.

Keywords: \pi\text{-calculus, \lambda\text{-calculus, coinduction, bisimulation, type system.}

This internship will take place in the Plume team of the LIP laboratory (ENS de Lyon). It will be jointly supervised by Daniel Hirschkoff (Plume) and Davide Sangiorgi (Università di Bologna and INRIA). Visits can be organised to discuss on the progress of the internship.
