In this paper, a characterization is given of Anosov flows on 3-manifolds whose stable and unstable foliations are  $C^\infty$ . It is shown that all such flows are obtained by making a special kind of change of parametrization of an algebraic flow. Examples are given of such flows which are not  $C^0$  conjugate to an algebraic flow. Moreover, this paper proves a conjecture of S. Hurder and A. Katok: If a negative curvature  $C^\infty$  metric on a compact surface has  $C^2$  horocycle foliation, then the curvature must be constant. For related results in higher dimensions, see the subsequent papers by M. Kanai [Ergodic Theory Dynamical Systems 8 (1988), no. 2, 215–239] and by R. Feres and Katok [“Rigidity of geodesic flows on negatively curved manifolds of dimensions 3 and 4”, Preprint, 1988; per revr.].
