en Informatique de Toulouse

Context and overview

Datacenter consumption and renewable sources

- ❖ Worldwide: 270 TWh in 2012
 - ❖ \approx Italy electricity consumption
 - ❖ High economical and environmental costs

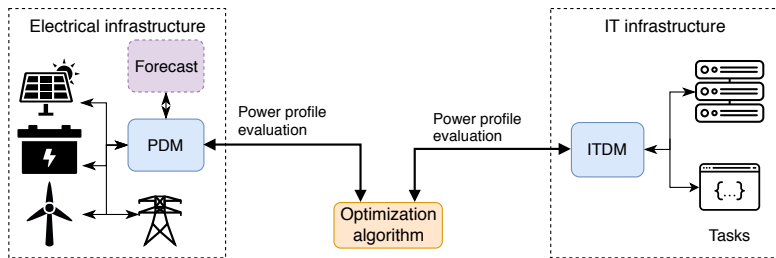

Possible mitigations

- ❖ Improve energy efficiency, software and hardware
- ❖ Use **renewable energy sources** power
 - ❖ Solar, wind: intermittent and little predictability
 - ❖ New challenges to make efficient use in datacenters

- ❖ ANR Datazero: on-site renewable sources
- ❖ IT and electrical cooperation

Context and overview of the problem

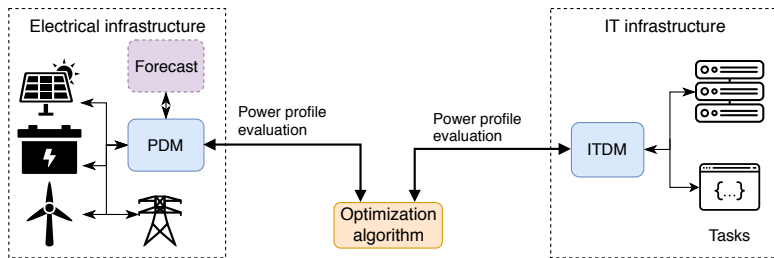

Separated IT and electrical optimizations

- ❖ Ability to evaluate power plan impact
- ❖ Internal objective (utility)
- ❖ Black box functions $\mathbb{R}^T \rightarrow \mathbb{R}$
- ❖ Computationally expensive

Context and overview of the problem

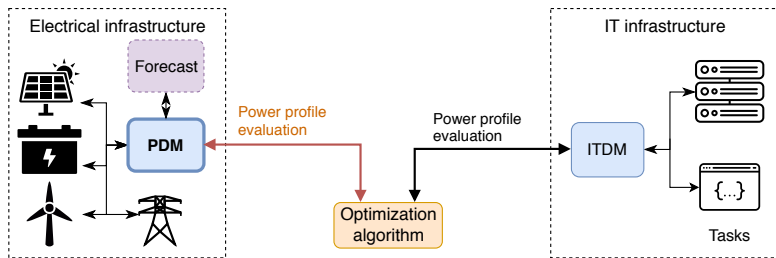

Separated IT and electrical optimizations

- Ability to evaluate **power plan** impact
- Internal objective (utility)
- Black box functions $\mathbb{R}^T \rightarrow \mathbb{R}$
- Computationally expensive

Context and overview of the problem

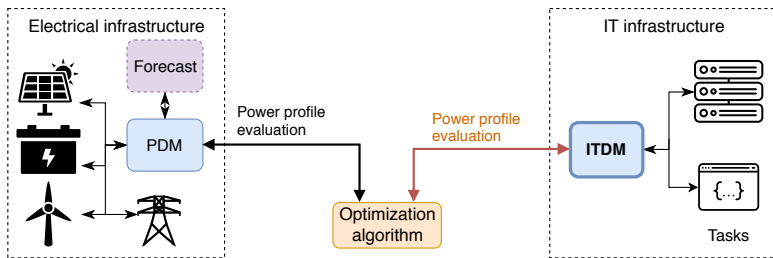

Separated IT and electrical optimizations

- Ability to evaluate power plan impact
- Internal objective (**utility**)
- Black box functions $\mathbb{R}^T \rightarrow \mathbb{R}$
- Computationally expensive

Context and overview of the problem

Separated IT and electrical optimizations

- Ability to evaluate power plan impact
- Internal objective (**utility**)
- Black box functions $\mathbb{R}^T \rightarrow \mathbb{R}$
- Computationally expensive

Multi-objective aspect

- ❖ Each DM has one or more objectives to satisfy
- ❖ Objectives may differ between DM
 - ❖ QoS related for ITDM, environmental impact for PDM

Managing different objectives

- ❖ Avoiding the problem: find common objective (money?)
- ❖ Scalarization (e.g. weighted sum)
- ❖ Finding a set of good solutions (set of possible trade-offs)

Multi-objective aspect

- ❖ Each DM has one or more objectives to satisfy
- ❖ Objectives may differ between DM
 - ❖ QoS related for ITDM, environmental impact for PDM

Managing different objectives

- ❖ Avoiding the problem: find common objective (money?)
- ❖ Scalarization (e.g. weighted sum)
- ❖ Finding a set of good solutions (set of possible trade-offs)

Multi-objective aspect

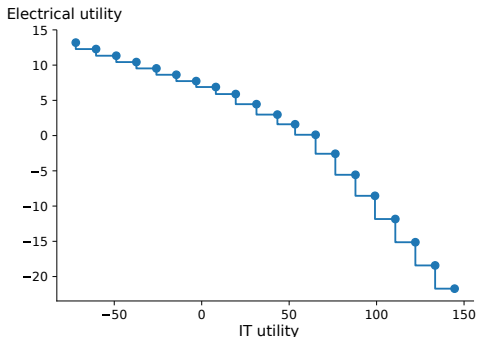

- ❖ Each DM has one or more objectives to satisfy
- ❖ Objectives may differ between DM
 - ❖ QoS related for ITDM, environmental impact for PDM

Managing different objectives

- ❖ Avoiding the problem: find common objective (money?)
- ❖ Scalarization (e.g. weighted sum)
- ❖ Finding a **set of good solutions** (set of possible trade-offs)

Multi-objective optimization and heuristics

- Find Pareto front (best trade-offs)

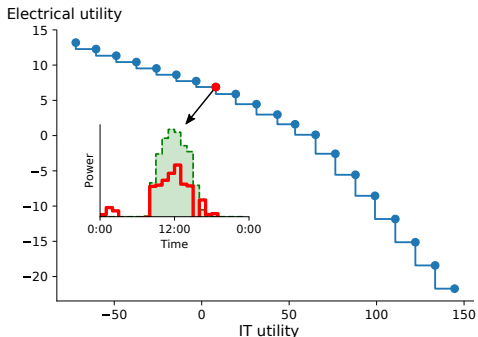

Multi-Objective Evolutionary Algorithms

- Well studied area, various approaches
- Focused on SPEA2 (genetic algorithm)

Multi-objective optimization and heuristics

- Find Pareto front (best trade-offs)

Multi-Objective Evolutionary Algorithms

- Well studied area, various approaches
- Focused on SPEA2 (genetic algorithm)

Multi-objective optimization and heuristics

- Focused on SPEA2 (genetic algorithm)

Multi-objective optimization and heuristics

- Find Pareto front (best trade-offs)

Multi-Objective Evolutionary Algorithms

- Well studied area, various approaches
- Focused on SPEA2 (genetic algorithm)

Approximation of power profile utility

- ❖ Evaluation of power profile is costly
 - ❖ Genetic algorithms require many evaluations
- ❖ Workaround: Utility approximation
 - ❖ Fast approximation based on known solutions
 - ❖ Evaluate only potentially good ones

Example: utility function, 2 time steps

Approximation of power profile utility

- ❖ Evaluation of power profile is costly
 - ❖ Genetic algorithms require many evaluations
- ❖ Workaround: **Utility approximation**
 - ❖ Fast approximation based on known solutions
 - ❖ Evaluate only potentially good ones

Example: utility function, 2 time steps

$$u = -0.29$$

Approximation of power profile utility

- ❖ Evaluation of power profile is costly
 - ❖ Genetic algorithms require many evaluations
- ❖ Workaround: Utility approximation
 - ❖ Fast approximation based on known solutions
 - ❖ Evaluate only potentially good ones

Example: utility function, 2 time steps

$$u = -0.29$$

Approximation of power profile utility

- ❖ Evaluation of power profile is costly
 - ❖ Genetic algorithms require many evaluations
- ❖ Workaround: Utility approximation
 - ❖ Fast approximation based on known solutions
 - ❖ Evaluate only potentially good ones

Example: utility function, 2 time steps

$$u = 0.41$$

Approximation of power profile utility

- ❖ Evaluation of power profile is costly
 - ❖ Genetic algorithms require many evaluations
- ❖ Workaround: Utility approximation
 - ❖ Fast approximation based on known solutions
 - ❖ Evaluate only potentially good ones

Example: utility function, 2 time steps

$$u = -1.2$$

Approximation of power profile utility

- ❖ Evaluation of power profile is costly
 - ❖ Genetic algorithms require many evaluations
- ❖ Workaround: Utility approximation
 - ❖ Fast approximation based on known solutions
 - ❖ Evaluate only potentially good ones

Example: utility function, 2 time steps

Only 2 dimensions, easy regression. What about 80 dimensions?

Constraints for approximation methods

Goal: find a function $\mathbb{R}^T \rightarrow \mathbb{R}$ (profile to utility).

- ❖ Online learning with few training data
 - ❖ Utility function changes between negotiations

Curse of dimensionality...

- ❖ \mathbb{R}^T is huge ($T > 100$ in many scenarios)
- ❖ Most regression methods become impractical

Constraints for approximation methods

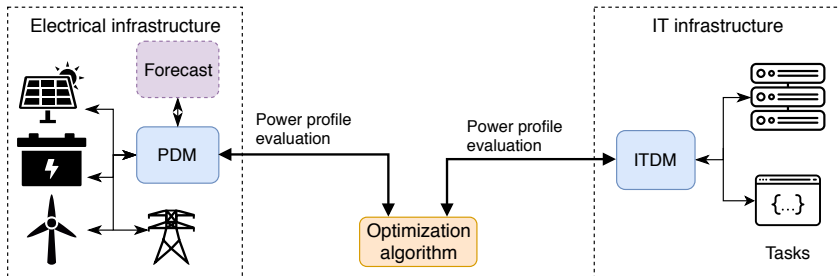

Goal: find a function $\mathbb{R}^T \rightarrow \mathbb{R}$ (profile to utility).

- ❖ Online learning with few training data
 - ❖ Utility function changes between negotiations

Curse of dimensionality...

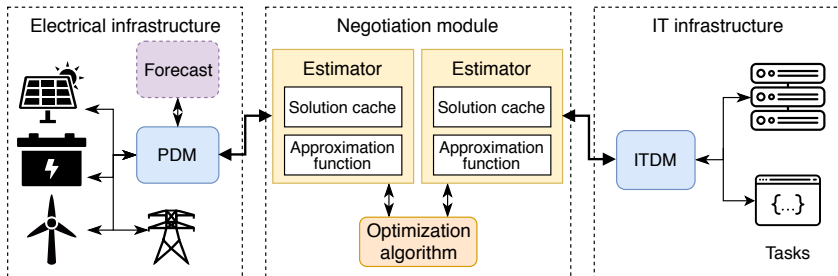

- ❖ \mathbb{R}^T is huge ($T > 100$ in many scenarios)
- ❖ Most regression method become impractical

Approximation in the overall infrastructure

- Improving negotiation for utility approximation
 - Estimator between negotiation algorithm and DM
 - Acts like a **smart cache**

Approximation in the overall infrastructure

- ❖ Improving negotiation for utility approximation
 - ❖ Estimator between negotiation algorithm and DM
 - ❖ Acts like a **smart cache**

Approach

Integration of objective approximation

- ❖ Asynchronous approximation integration
 - ❖ Evaluation may be replaced by approximation
 - ❖ Mix of evaluated and approximated individuals

Integration of objective approximation

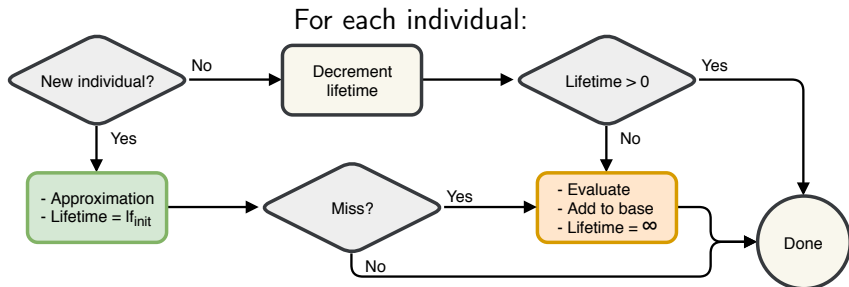

- ❖ Asynchronous approximation integration
 - ❖ Evaluation may be replaced by approximation
 - ❖ Mix of evaluated and approximated individuals

Integration of objective approximation (2)

Attribution of objective values

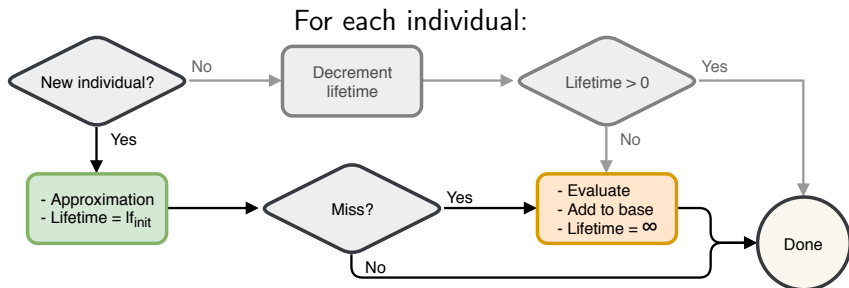

- ❖ Lifetime associated to individuals
- ❖ Evaluated if conserved until lifetime is zero (archive)
 - ❖ Added to knowledge base

Integration of objective approximation (2)

Attribution of objective values

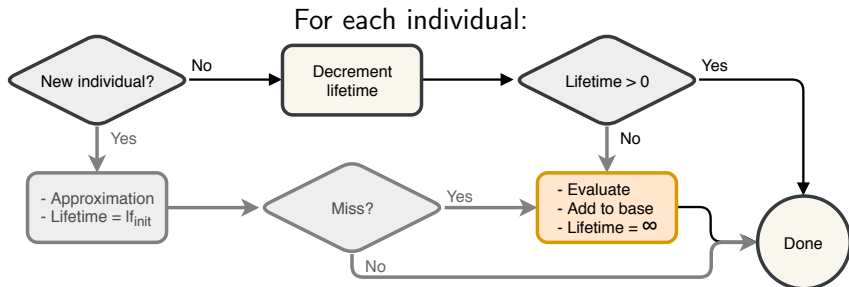

- ❖ Lifetime associated to individuals
- ❖ Evaluated if conserved until lifetime is zero (archive)
 - ❖ Added to knowledge base

Integration of objective approximation (2)

Attribution of objective values

- ❖ Lifetime associated to individuals

 - ❖ Added to knowledge base

Integration of objective approximation (2)

Attribution of objective values

- ❖ Lifetime associated to individuals
- ❖ Evaluated if conserved until lifetime is zero (archive)
 - ❖ Added to knowledge base

Limitations of SPEA2

SPEA2 not well adapted to asynchronous approximation

- ❖ Limited archive of individuals
- ❖ Bad (optimistic) approximations → good solutions lost
- ❖ Still approximated solutions after ending condition reached

Limitations of SPEA2

SPEA2 not well adapted to asynchronous approximation

- ❖ Limited archive of individuals
- ❖ Bad (optimistic) approximations → good solutions lost
- ❖ Still approximated solutions after ending condition reached

Limitations of SPEA2

SPEA2 not well adapted to asynchronous approximation

- ❖ Limited archive of individuals
- ❖ **Bad (optimistic) approximations** → good solutions lost
- ❖ Still approximated solutions after ending condition reached

Limitations of SPEA2

SPEA2 not well adapted to asynchronous approximation

- ❖ Limited archive of individuals
- ❖ Bad (optimistic) approximations → **good solutions lost**
- ❖ Still approximated solutions after ending condition reached

Uncertain-SPEA2 (USPEA2)

Modify SPEA2 to manage uncertain solutions (approximations)

- ✦ Add an archive of evaluated solutions (certain archive)
- ✦ Avoiding duplication of individuals

Stopping USPEA2 at any time results in a set of valid solutions.

Overview

Haar wavelet transform

Extract frequency and temporal features of a signal.

- ✦ Fast to compute
- ✦ Works well with discrete series
- ✦ \approx successive mean between time steps
- ✦ Conserve euclidean distances

Overview

Haar wavelet transform

Extract frequency and temporal features of a signal.

- ❖ Fast to compute
- ❖ Works well with discrete series
- ❖ \approx successive mean between time steps
- ❖ Conserve euclidean distances

(8, 6, 1, 5)

Overview

Haar wavelet transform

Extract frequency and temporal features of a signal.

- ✦ Fast to compute
- ✦ Works well with discrete series
- ✦ \approx successive mean between time steps
- ✦ Conserve euclidean distances

(8, 6, 1, 5)

$H_2 = [1, -2]$

Overview

Haar wavelet transform

Extract frequency and temporal features of a signal.

- ❖ Fast to compute

- ❖ \approx successive mean between time steps
- ❖ Conserve euclidean distances

(8, 6, 1, 5)

$H_2 = [1, -2]$

$H_1 = [2]$

Overview

Haar wavelet transform

Extract frequency and temporal features of a signal.

- ❖ Fast to compute
- ❖ Works well with discrete series
- ❖ \approx successive mean between time steps
- ❖ Conserve euclidean distances

(8, 6, 1, 5)

$H_2 = [1, -2]$

$H_1 = [2]$

$H_0 = [5]$

Multi-resolution Haar approximation

- ❖ Distance between **partial** Haar representations from known solutions
 - ❖ **Lowest frequencies** features first
- ❖ Select known solutions closer than a threshold
- ❖ If enough solutions: repeat with higher frequency
- ❖ Result: weighted average of close utilities
- ❖ Complexity: $O(n \log(n))$ (n solutions in base)

Multi-resolution Haar approximation

- ❖ Distance between partial Haar representations from known solutions
 - ❖ Lowest frequencies features first
- ❖ Select known solutions closer than a threshold
- ❖ If enough solutions: **repeat with higher frequency**
- ❖ Result: weighted average of close utilities
- ❖ Complexity: $O(n \log(n))$ (n solutions in base)

Multi-resolution Haar approximation

- ❖ If enough solutions: repeat with higher frequency
- ❖ Result: weighted average of close utilities
- ❖ Complexity: $O(n \log(n))$ (n solutions in base)

Methodology and evaluation

Quality indicators

Hypervolume indicator

Area covered between Pareto front of solution set and any reference point.

- ❖ \geq if solutions are better (dominate)
- ❖ \geq if solution set is more spread

Generational distance

Average distance between approximation front and best known Pareto front

- ❖ Requires a good comparison set

Quality indicators

Hypervolume indicator

Area covered between Pareto front of solution set and **any reference point**.

- ❖ \geq if solutions are better (dominate)
- ❖ \geq if solution set is more spread

Generational distance

Average distance between approximation front and best known Pareto front

- ❖ Requires a good comparison set

Quality indicators

Hypervolume indicator

Area covered between Pareto front of solution set and any reference point.

Generational distance

Average distance between approximation front and **best known Pareto front**

- ❖ Requires a good comparison set

Infrastructure and decision modules

Simplified models, keep optimum computable

IT decision module

- «Fluid» workload: total amount of CPU time
- Utility: revenue
 - Reward for each unit scheduled
 - Incentive to execute unit early

Electrical decision module

- Solar panels, batteries, electrical grid in/out
- Utility: equivalent CO2 emission
 - Zero for renewable
 - Grid electricity average emission
 - Battery aging, based on manufacturing cost

Evaluation

- ❖ 3 days scenarios
- ❖ Workload: 75% of maximum data center capacity
 - ❖ **ExcessRenew**: sunny days, initial battery 50%
 - ❖ Normal: less sunny days
 - ❖ FewRenew: almost no sun, initial battery at 25%

- ❖ Optimal formulation → comparison Pareto front
- ❖ (U)SPEA2 ending condition: budget of utility evaluations

Budget of evaluations

Scenario *Normal*, 80 time steps

Scenarios and number of time steps

Budget of 100 evaluations

80 time steps

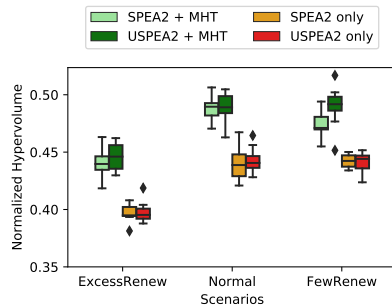

Scenarios and number of time steps

Budget of 100 evaluations

80 time steps

320 time steps

Some unexpected results

Initial profiles: **Best profiles** from each DM

- ❖ Approximation method AD: naive and usually \approx baseline

Some unexpected results

Initial profiles: **Best profiles** from each DM

- ❖ Approximation method AD: naive and usually \approx baseline

Conclusion

Conclusion

- ❖ Find set of trade-offs power plans
- ❖ Approximation of power profile utility valuable
 - ❖ More objective space covered
 - ❖ Similar hypervolume for 1/3rd to 1/5th evaluations
 - ❖ Difficult to predict performances in advance...
- ❖ USPEA2 ensure stable results with approximation
 - ❖ Similar to SPEA2 without approximation

Future works

- Repeated planning policies: choosing a solution
- Better understanding of MOEA/approximation relationship

Conclusion
